\*1:  $I_{s1}$  is specified at the 5% drop point of output voltage  $V_o$  on the condition that  $V_{IN} = 3.3 \text{ V}$  (5 V for SI-3033LSA), and  $I_o = 0.5 \text{ A}$ .

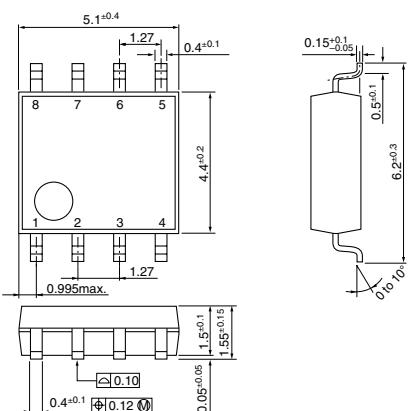

\*2: Output is OFF when the output control terminal  $V_c$  is open. Each input level is equivalent to LS-TTL level. Therefore, the device can be driven directly by LS-TTls.

\*3: These products cannot be used in the following applications. Because these applications require a certain current at start-up and so the built-in foldback-type overcurrent protection may cause errors during start-up stage.

(1) Constant current load (2) Positive and negative power supply (3) Series-connected power supply (4)  $V_o$  adjustment by raising ground voltage

### PCB Copper Laminate Area vs. Junction to Ambient Air Thermal Resistance

### Allowable Output Current (vs. VIN-Vout Voltage Difference) VIN-Io max

The inner frame stage, on which the PTr is mounted, is directly connected to the Vout pin.

Therefore, enlarging the copper laminate area around the Vout pin is really effective for a heat radiation.
