

# MITSUBISHI MICROCOMPUTERS M37224M3-XXXSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## DESCRIPTION

The M37224M3-XXXSP is a single-chip microcomputer designed with CMOS silicon gate technology. They are housed in a 42-pin shrink plastic molded DIP.

In addition to their simple instruction sets, the ROM, RAM and I/O addresses are placed on the same memory map to enable easy programming.

The M37224M3-XXXSP has a PWM output function and a OSD display function, so it is useful for a channel selection system for TV.

## FEATURES

- Number of basic instructions ..... 71
- Memory size
  - ROM ..... 12 K bytes
  - RAM ..... 256 bytes
  - ROM for display ..... 8 K bytes
  - RAM for display ..... 96 bytes
- Minimum instruction execution time
  - ..... 0.5  $\mu$ s (at 8 MHz oscillation frequency)
- Power source voltage ..... 5 V  $\pm$  10 %
- Power dissipation ..... 165 mW  
(at 8 MHz oscillation frequency, V<sub>CC</sub>=5.5V, at CRT display)
- Subroutine nesting ..... 96 levels (maximum)
- Interrupts ..... 13 types, 13 vectors
- 8-bit timers ..... 4
- Programmable I/O ports (Ports P0, P1, P2, P30–P32) ..... 27
- Input ports (Ports P33, P34) ..... 2
- Output ports (Ports P52–P55) ..... 4
- 12 V withstand ports ..... 6
- LED drive ports ..... 4
- Serial I/O ..... 8-bit  $\times$  1 channel
- A-D comparator (6-bit resolution) ..... 6 channels
- D-A converter (6-bit resolution) ..... 2
- PWM output circuit ..... 14-bit  $\times$  1, 8-bit  $\times$  6
- ROM correction function ..... 32 bytes  $\times$  2

## PIN CONFIGURATION (TOP VIEW)

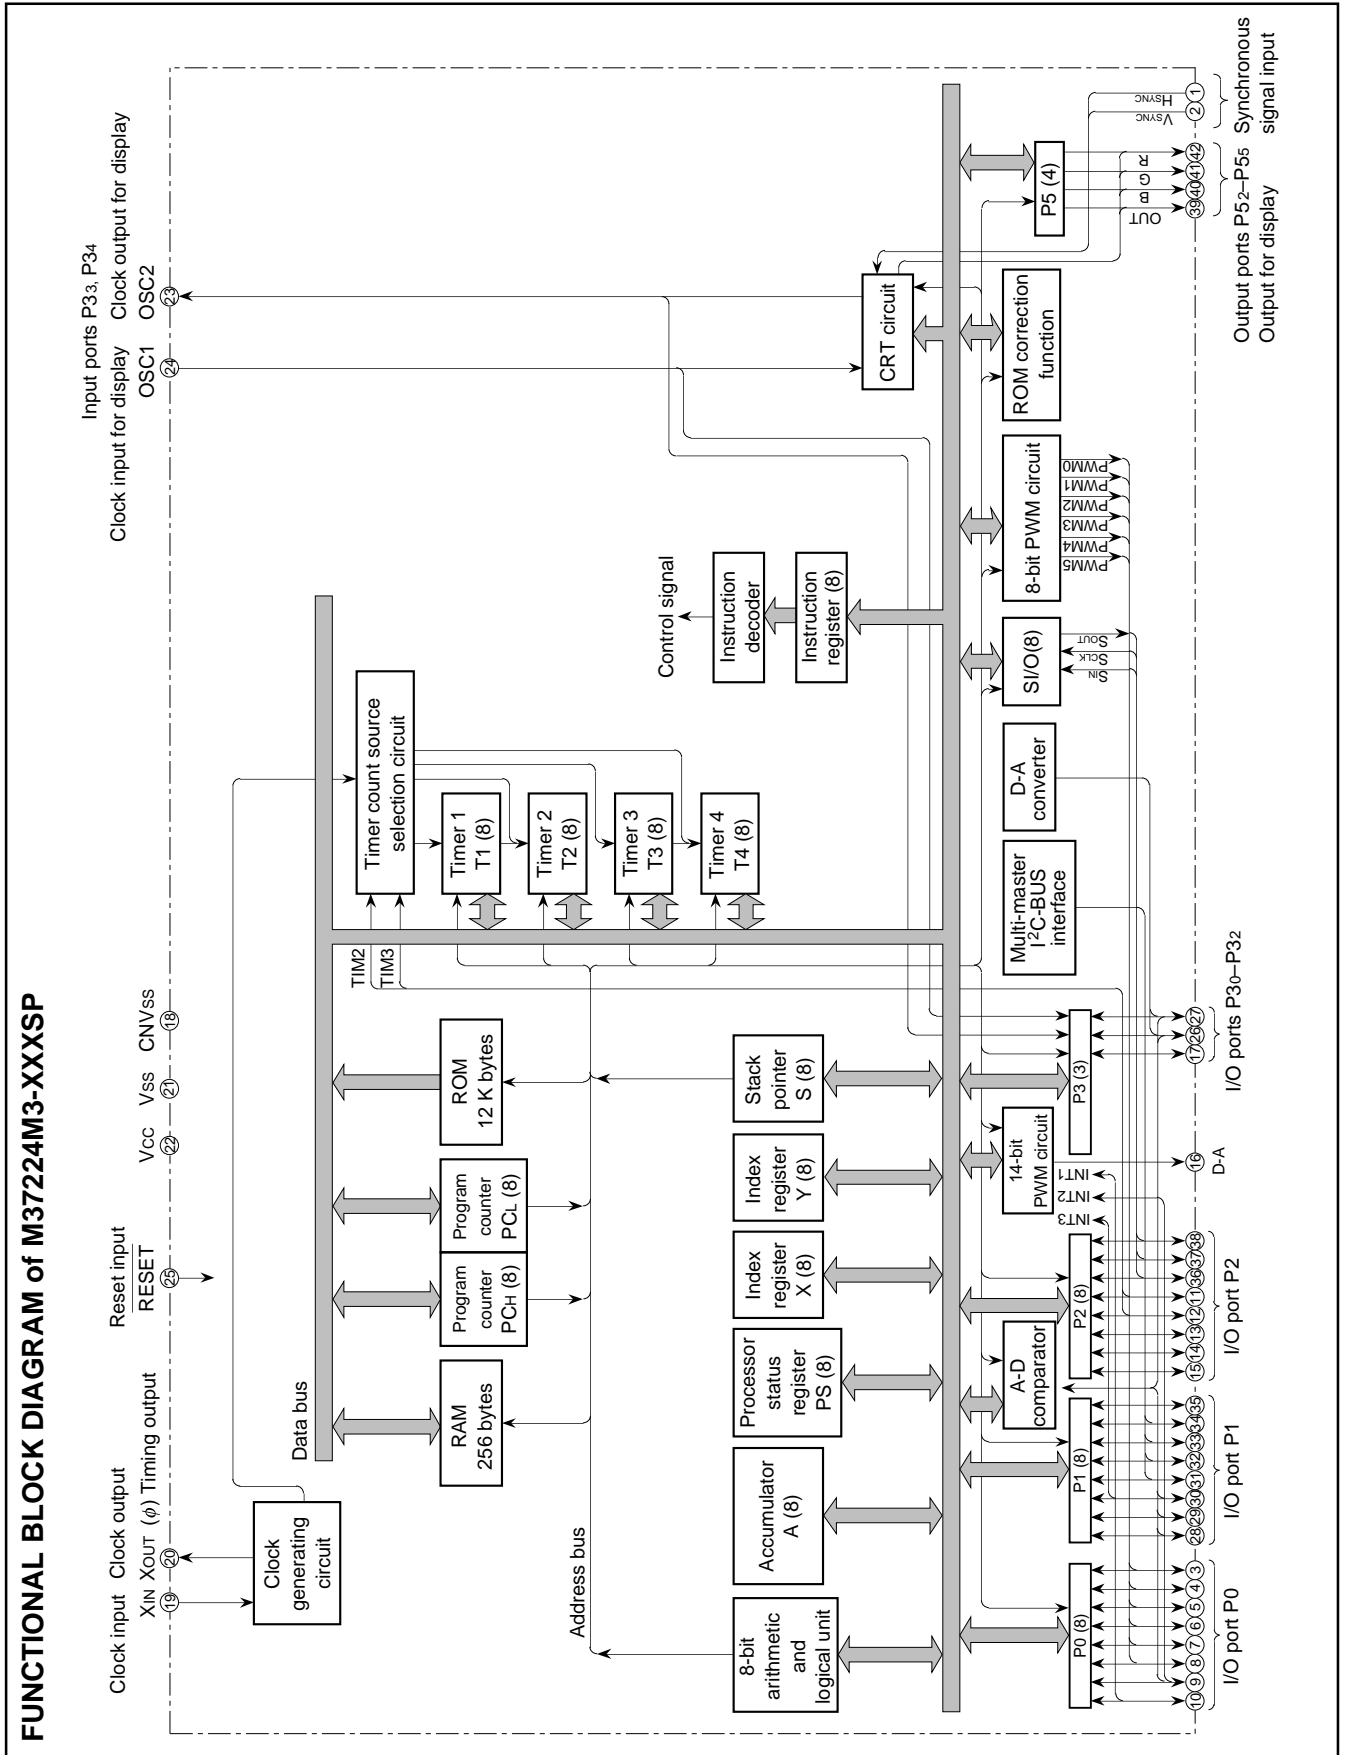

## • CRT display function

- Number of display characters ..... 20 characters  $\times$  2 lines  
(16 lines maximum)
- Kinds of characters ..... 128 kinds
- Dot structure ..... 12  $\times$  16 dots
- Kinds of character sizes ..... 3 kinds
- Kinds of character colors (It can be specified by the character)  
maximum 7 kinds (R, G, B)
- Kinds of raster colors (maximum 7 kinds)
- Display position
  - Horizontal ..... 64 levels
  - Vertical ..... 128 levels
- Bordering (horizontal and vertical)

## APPLICATION

TV

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

**FUNCTIONS**

Parameter		Functions	
Number of basic instructions		71	
Instruction execution time		0.5 $\mu$ s (the minimum instruction execution time, at 8 MHz oscillation frequency)	
Clock frequency		8 MHz (maximum)	
Memory size	ROM	12 K bytes	
	RAM	256 bytes	
	CRT ROM	4 K bytes	
	CRT RAM	80 bytes	
Input/Output ports	P0	I/O	8-bit X 1 (N-channel open-drain output structure, can be used as PWM output pins, INT input pins, A-D input pin)
	P10–P17	I/O	8-bit X 1 (CMOS input/output structure, can be used as A-D input pins, INT input pin)
	P20, P21	I/O	2-bit X 1 (CMOS input/output or N-channel open-drain output structure, can be used as serial I/O pins)
	P22–P27	I/O	6-bit X 1 (CMOS input/output structure, can be used as serial input pin, external clock input pins)
	P30, P31	I/O	2-bit X 1 (CMOS input/output or N-channel open-drain output structure, can be used as A-D input pins, D-A conversion output pins)
	P32	I/O	1-bit X 1 (N-channel open-drain output structure)
	P33, P34	Input	2-bit X 1 (can be used as CRT display clock I/O pins)
	P52–P55	Output	4-bit X 1 (CMOS output structure, can be used as CRT output pins)
Serial I/O		8-bit X 1	
A-D comparator		6 channels (6-bit resolution)	
D-A converter		2 (7-bit resolution)	
PWM output circuit		14-bit X 1, 8-bit X 6	
Timers		8-bit timer X 4	
ROM correction function		32 bytes X 2	
Subroutine nesting		96 levels (maximum)	
Interrupt		External interrupt X 3, Internal timer interrupt X 4, Serial I/O interrupt X 1, CRT interrupt X 1, f(XIN)/4096 interrupt X 1, VSYNC interrupt X 1, BRK interrupt X 1	
Clock generating circuit		2 built-in circuits (externally connected to a ceramic resonator or a quartz-crystal oscillator)	
Power source voltage		5 V $\pm$ 10 %	
Power dissipation	CRT ON	165 mW typ. (at oscillation frequency f(XIN) = 8 MHz, fCRT = 8 MHz)	
	CRT OFF	110 mW typ. (at oscillation frequency f(XIN) = 8 MHz)	
	In stop mode	1.65 mW (maximum)	
Operating temperature range		-10 °C to 70 °C	
Device structure		CMOS silicon gate process	
Package		42-pin shrink plastic molded DIP	
CRT display function	Number of display characters	20 characters X 2 lines (maximum 16 lines by software)	
	Dot structure	12 X 16 dots	
	Kinds of characters	128 kinds	
	Kinds of character sizes	3 kinds	
	Kinds of character colors	Maximum 7 kinds (R, G, B); can be specified by the character	
	Display position (horizontal, vertical)	64 levels (horizontal) X 128 levels (vertical)	

**PIN DESCRIPTION**

Pin	Name	Input/ Output	Functions
VCC, VSS.	Power source		Apply voltage of 5 V ± 10 % (typical) to VCC, and 0 V to VSS.
CNVSS	CNVSS		Connected to VSS.
RESET	Reset input	Input	To enter the reset state, the reset input pin must be kept at a "L" for 2 μs or more (under normal VCC conditions). If more time is needed for the quartz-crystal oscillator to stabilize, this "L" condition should be maintained for the required time.
XIN	Clock input	Input	This chip has an internal clock generating circuit. To control generating frequency, an external ceramic resonator or a quartz-crystal oscillator is connected between pins XIN and XOUT. If an external clock is used, the clock source should be connected to the XIN pin and the XOUT pin should be left open.
XOUT	Clock output	Output	
P00/PWM0– P05/PWM5, P06/INT2/ A-D4, P07/INT1	I/O port P0	I/O	Port P0 is an 8-bit I/O port with direction register allowing each I/O bit to be individually programmed as input or output. At reset, this port is set to input mode. The output structure is N-channel open-drain output. See notes at end of Table for full details of port P0 functions.
	PWM output	Output	Pins P00–P05 are also used as PWM output pins PWM0–PWM5 respectively. The output structure is N-channel open-drain output.
	External interrupt input	Input	Pins P06, P07 are also used as external interrupt input pins INT2, INT1 respectively.
	Analog input	Input	P06 pin is also used as analog input pin A-D4.
P10–P14, P15/A-D1/ INT3, P16/A-D2, P17/A-D3	I/O port P1	I/O	Port P1 is an 8-bit I/O port and has basically the same functions as port P0. The output structure is CMOS output.
	Analog input	Input	Pins P15–P17 are also used as analog input pins A-D1 to A-D3 respectively.
	External interrupt input	Input	P15 pin is also used as external interrupt input pin INT3.
P20/SCLK, P21/SOUT, P22/SIN, P23/TIM3, P24/TIM2, P25–P27	I/O port P2	I/O	Port P2 is an 8-bit I/O port and has basically the same functions as port P0. The output structure is CMOS output.
	External clock input	Input	Pins P23, P24 are also used as external clock input pins TIM3, TIM2 respectively.
	Serial I/O synchronous clock input/output	I/O	P20 pin is also used as serial I/O synchronous clock input/output pin SCLK. The output structure is N-channel open-drain output.
	Serial I/O data output	Output	Pin P21 is also used as serial I/O data output pin SOUT. The output structure is N-channel open-drain output.
P30/A-D5/ DA1, P31/A-D6/ DA2, P32	I/O port P3	I/O	Ports P30–P32 are 3-bit I/O ports and have basically the same functions as port P0. Either CMOS output or N-channel open-drain output structure can be selected as the port P30 and P31. The output structure of port P32 is N-channel open-drain output.
	Analog input	Input	Pins P30, P31 are also used as analog input pins A-D5, A-D6 respectively.
	D-A conversion output	Output	Pins P30, P31 are also used as D-A conversion output pins DA1, DA2 respectively.
P33/OSC1, P34/OSC2	Input port P3	Input	Ports P33, P34 are 2-bit input ports.
	Clock input for CRT display	Input	P33 pin is also used as CRT display clock input pin OSC1.
	Clock output for CRT display	Output	P34 pin is also used as CRT display clock output pin OSC2. The output structure is CMOS output.

**PIN DESCRIPTION (continued)**

Pin	Name	Input/ Output	Functions
P52/R, P53/G, P54/B, P55/OUT	Output port P5	Output	Ports P52–P55 are a 4-bit output port. The output structure is CMOS output.
	CRT output	Output	Pins P52–P55 are also used as CRT output pins R, G, B, OUT respectively. The output structure is CMOS output.
HSYNC	HSYNC input	Input	This is a horizontal synchronous signal input for CRT.
VSYNC	VSYNC input	Input	This is a vertical synchronous signal input for CRT.
D-A	DA output	Output	This is a 14-bit PWM output pin.

**Note :** As shown in the memory map (Figure 5), port P0 is accessed as a memory at address  $00C0_{16}$  of zero page. Port P0 has the port P0 direction register (address  $00C1_{16}$  of zero page) which can be used to program each bit as an input ("0") or an output ("1"). The pins programmed as "1" in the direction register are output pins. When pins are programmed as "0," they are input pins. When pins are programmed as output pins, the output data are written into the port latch and then output. When data is read from the output pins, the output pin level is not read but the data of the port latch is read. This allows a previously-output value to be read correctly even if the output LOW voltage has risen, for example, because a light emitting diode was directly driven. The input pins are float, so the values of the pins can be read. When data is written into the input pin, it is written only into the port latch, while the pin remains in the floating state.

**FUNCTIONAL DESCRIPTION**  
**Central Processing Unit (CPU)**

The M37224M3-XXXSP uses the standard 740 Family instruction set. Refer to the table of 740 Family addressing modes and machine instructions or the SERIES 740 <Software> User's Manual for details on the instruction set.

Machine-resident 740 family instructions are as follows:

The FST, SLW instruction cannot be used.

The MUL, DIV, WIT and STP instructions can be used.

**CPU Mode Register**

The CPU mode register contains the stack page selection bit. The CPU mode register is allocated at address 00FB16.

Fig. 3. CPU Mode Register

**MEMORY**

**Special Function Register (SFR) Area**

The special function register (SFR) area in the zero page contains control registers such as I/O ports and timers.

**RAM**

RAM is used for data storage and for stack area of subroutine calls and interrupts.

**ROM**

ROM is used for storing user programs as well as the interrupt vector area.

**RAM for Display**

RAM for display is used for specifying the character codes and colors to display.

**ROM for Display**

ROM for display is used for storing character data.

**Interrupt Vector Area**

The interrupt vector area contains reset and interrupt vectors.

**Zero Page**

The 256 bytes from addresses 0000<sub>16</sub> to 00FF<sub>16</sub> are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

**Special Page**

The 256 bytes from addresses FF00<sub>16</sub> to FFFF<sub>16</sub> are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

**ROM Correction Memory (RAM)**

This is used as the program area for ROM correction.

Fig. 8. Internal State of Processor Status Register and Program Counter at Reset

## INTERRUPTS

Interrupts can be caused by 13 different sources consisting of 4 external, 7 internal, 1 software, and reset. Interrupts are vectored interrupts with priorities shown in Table 1. Reset is also included in the table because its operation is similar to an interrupt.

When an interrupt is accepted,

- (1) The contents of the program counter and processor status register are automatically stored into the stack.
- (2) The interrupt disable flag I is set to "1" and the corresponding interrupt request bit is set to "0."
- (3) The jump destination address stored in the vector address enters the program counter.

Other interrupts are disabled when the interrupt disable flag is set to "1."

All interrupts except the BRK instruction interrupt have an interrupt request bit and an interrupt enable bit. The interrupt request bits are in interrupt request registers 1 and 2 and the interrupt enable bits are in interrupt control registers 1 and 2. Figures 10 to 14 show the interrupt-related registers.

Interrupts other than the BRK instruction interrupt and reset are accepted when the interrupt enable bit is "1," interrupt request bit is "1," and the interrupt disable flag is "0." The interrupt request bit can be set to "0" by a program, but not set to "1." The interrupt enable bit can be set to "0" and "1" by a program.

Reset is treated as a non-maskable interrupt with the highest priority. Figure 9 shows interrupt control.

## Interrupt Causes

- (1) VSYNC and CRT interrupts

The VSYNC interrupt is an interrupt request synchronized with the vertical sync signal.

The CRT interrupt occurs after character block display to the CRT is completed.

- (2) INT1, INT2, INT3 interrupts

With an external interrupt input, the system detects that the level of a pin changes from "L" to "H" or from "H" to "L," and generates an interrupt request. The input active edge can be selected by bits 3, 4 and 5 of the interrupt input polarity register (address 00F9<sub>16</sub>): when this bit is "0," a change from "L" to "H" is detected; when it is "1," a change from "H" to "L" is detected. Note that all bits are cleared to "0" at reset.

- (3) Timer 1, 2, 3 and 4 interrupts

An interrupt is generated by an overflow of timer 1, 2, 3 or 4.

- (4) Serial I/O interrupt

This is an interrupt request from the clock synchronous serial I/O function.

Table 1. Interrupt Vector Addresses and Priority

Interrupt Source	Priority	Vector Addresses	Remarks
Reset	1	FFFF <sub>16</sub> , FFFE <sub>16</sub>	Non-maskable
CRT interrupt	2	FFFD <sub>16</sub> , FFFC <sub>16</sub>	
INT2 interrupt	3	FFFB <sub>16</sub> , FFFA <sub>16</sub>	Active edge selectable
INT1 interrupt	4	FFF9 <sub>16</sub> , FFF8 <sub>16</sub>	Active edge selectable
Timer 4 interrupt	5	FFF5 <sub>16</sub> , FFF4 <sub>16</sub>	
f(XIN)/4096 interrupt	6	FFF3 <sub>16</sub> , FFF2 <sub>16</sub>	
VSYNC interrupt	7	FFF1 <sub>16</sub> , FFF0 <sub>16</sub>	Active edge selectable
Timer 3 interrupt	8	FFEF <sub>16</sub> , FFEE <sub>16</sub>	
Timer 2 interrupt	9	FFED <sub>16</sub> , FFEC <sub>16</sub>	
Timer 1 interrupt	10	FFEB <sub>16</sub> , FFEA <sub>16</sub>	
Serial I/O interrupt	11	FFE9 <sub>16</sub> , FFE8 <sub>16</sub>	
INT3 interrupt	12	FFE5 <sub>16</sub> , FFE4 <sub>16</sub>	Active edge selectable
BRK instruction interrupt	13	FFDF <sub>16</sub> , FFDE <sub>16</sub>	Non-maskable (software interrupt)

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

(5)  $f(X_{IN})/4096$  interrupt

This interrupt occurs regularly with a  $f(X_{IN})/4096$  period. Set bit 0 of the PWM output control register 1 to "0."

(6) BRK instruction interrupt

This software interrupt has the least significant priority. It does not have a corresponding interrupt enable bit, and it is not affected by the interrupt disable flag I (non-maskable).

## TIMERS

The M37224M3-XXXSP has 4 timers: timer 1, timer 2, timer 3, and timer 4. All timers are 8-bit timer with the 8-bit timer latch. The timer block diagram is shown in Figure 17.

All of the timers count down and their divide ratio is  $1/(n+1)$ , where  $n$  is the value of timer latch. By writing a count value to the corresponding timer latch (addresses 00F0<sub>16</sub> to 00F3<sub>16</sub>), the value is also set to a timer, simultaneously.

The count value is decremented by 1. The timer interrupt request bit is set to "1" by a timer overflow at the next count pulse, after the count value reaches "00<sub>16</sub>".

### (1) Timer 1

Timer 1 can select one of the following count sources:

- $f(X_{IN})/16$
- $f(X_{IN})/4096$

The count source of timer 1 is selected by setting bit 0 of the timer 12 mode register (address 00F4<sub>16</sub>).

Timer 1 interrupt request occurs at timer 1 overflow.

### (2) Timer 2

Timer 2 can select one of the following count sources:

- $f(X_{IN})/16$
- Timer 1 overflow signal
- External clock from the TIM2 pin

The count source of timer 2 is selected by setting bits 1 and 4 of timer 12 mode register (address 00F4<sub>16</sub>). When timer 1 overflow signal is a count source for timer 2, timer 1 functions as an 8-bit prescaler.

Timer 2 interrupt request occurs at timer 2 overflow.

### (3) Timer 3

Timer 3 can select one of the following count sources:

- $f(X_{IN})/16$
- External clock from the HSYNC pin
- External clock from the TIM3 pin

The count source of timer 3 is selected by setting bits 0 and 5 of timer 34 mode register (address 00F5<sub>16</sub>).

Timer 3 interrupt request occurs at timer 3 overflow.

### (4) Timer 4

Timer 4 can select one of the following count sources:

- $f(X_{IN})/16$
- $f(X_{IN})/2$
- Timer 3 overflow signal

The count source of timer 4 is selected by setting bits 1 and 4 of timer 34 mode register (address 00F5<sub>16</sub>). When timer 3 overflow signal is a count source for timer 4, timer 3 functions as an 8-bit prescaler.

Timer 4 interrupt request occurs at timer 4 overflow.

At reset, timers 3 and 4 are connected by hardware and "FF<sub>16</sub>" is automatically set in timer 3; "07<sub>16</sub>" in timer 4. The  $f(X_{IN})/16$  is selected as the timer 3 count source. The internal reset is released by timer 4 overflow in this state and the internal clock is connected.

At execution of the STP instruction, timers 3 and 4 are connected by hardware and "FF<sub>16</sub>" is automatically set in timer 3; "07<sub>16</sub>" in timer 4. However, the  $f(X_{IN})/16$  is not selected as the timer 3 count source. So set bit 0 of timer 34 mode register (address 00F5<sub>16</sub>) to "0" before execution of the STP instruction ( $f(X_{IN})/16$  is selected as the timer 3 count source). The internal STP state is released by timer 4 overflow in this state and the internal clock is connected.

As a result of the above procedure, the program can start under a stable clock.

Timer-related registers are shown in Figures 15 and 16.

Timer 12 Mode Register

Fig. 16. Timer 34 Mode Register

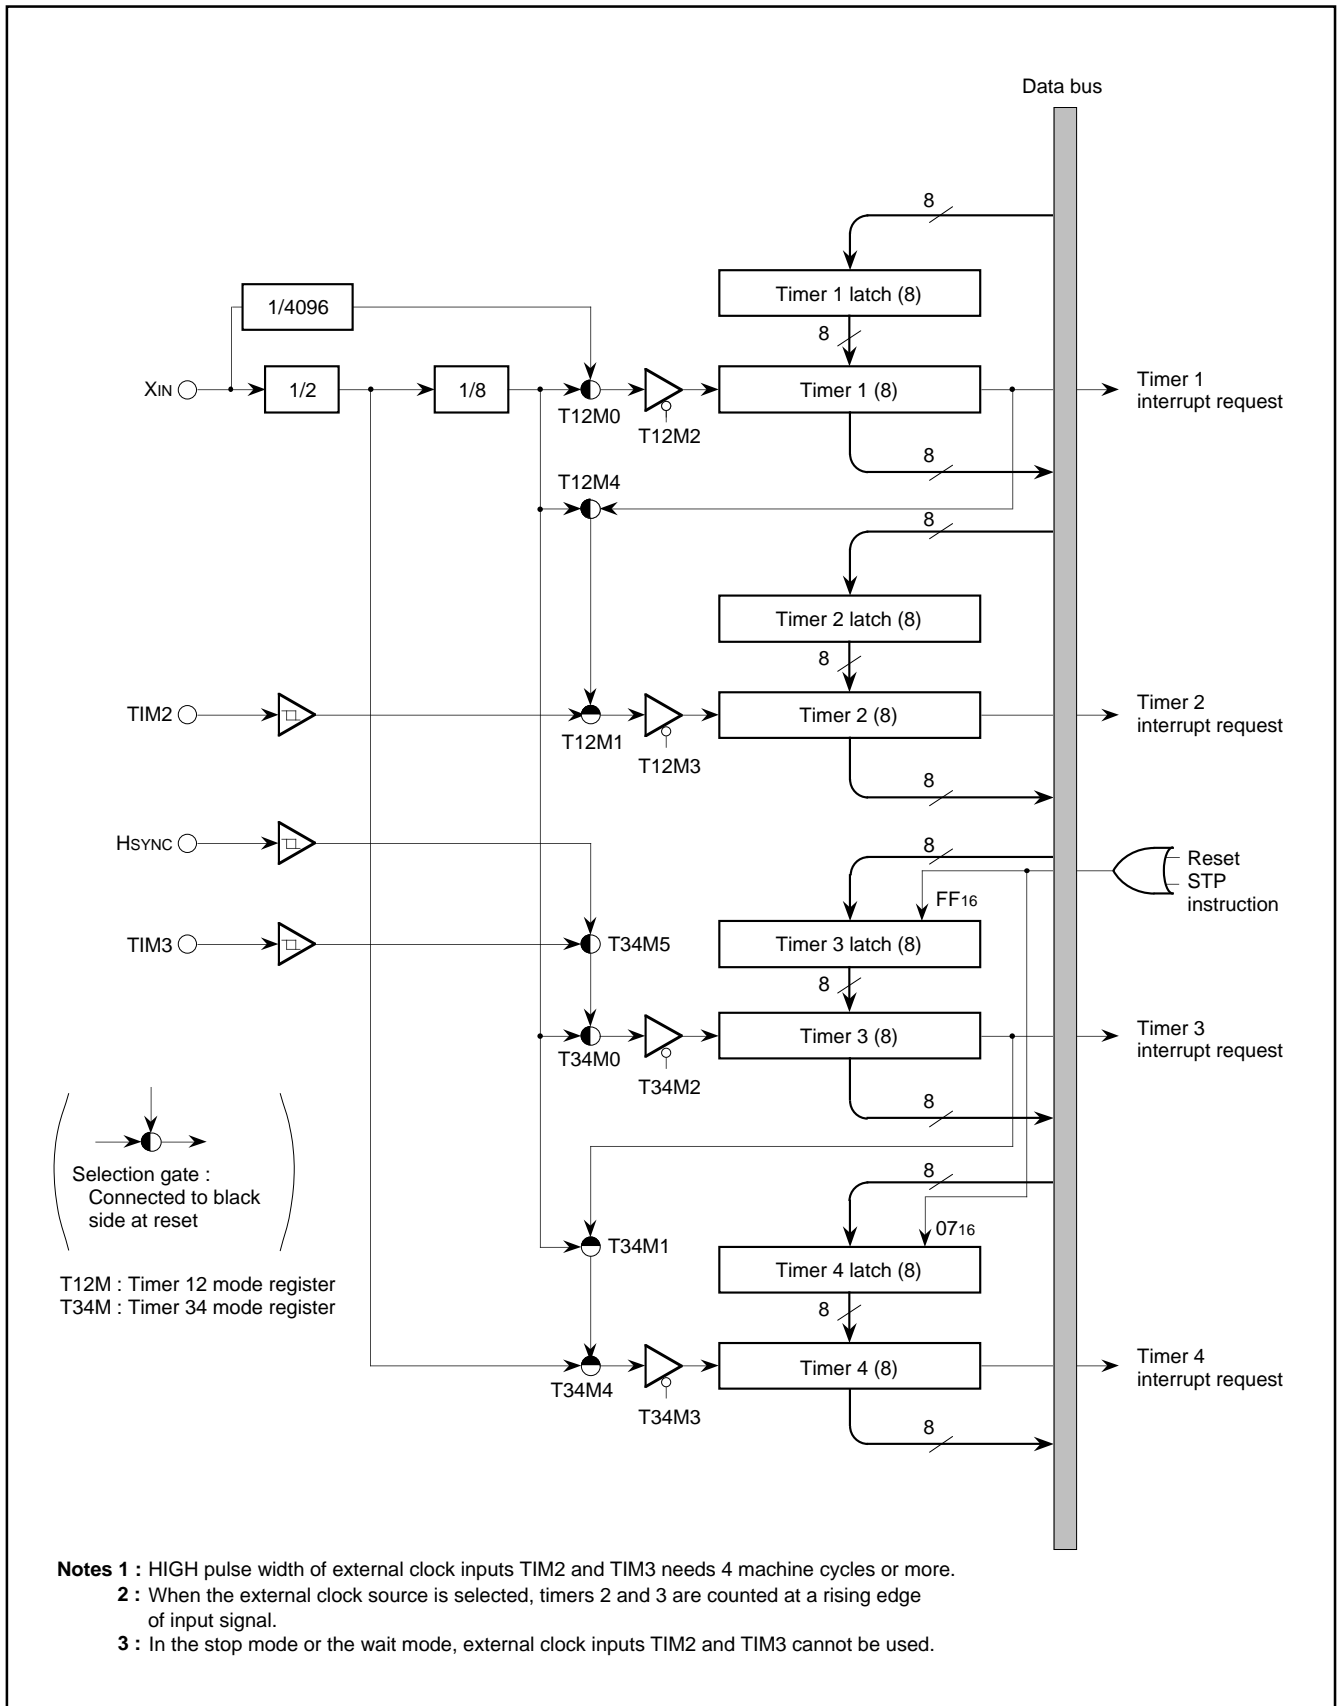

Fig. 17. Timer Block Diagram

**SERIAL I/O**

The M37224M3-XXXSP has a built-in serial I/O which can either transmit or receive 8-bit data serially in the clock synchronous mode.

The serial I/O block diagram is shown in Figure 18. The synchronous clock I/O pin (SCLK), and data I/O pins (SOUT, SIN) also function as port P2.

Bit 2 of the serial I/O mode register (address 00DC16) selects whether the synchronous clock is supplied internally or externally (from the P20/SCLK pin). When an internal clock is selected, bits 1 and 0 select whether  $f(XIN)$  is divided by 4, 16, 32, or 64. Bit 3 selects whether port P2 is used for serial I/O or not. To use the P22/SIN pin as the SIN pin, set the bit 2 of the port P2 direction register (address 00C516) to "0."

The operation of the serial I/O is described below. The operation differs depending on the clock source; external clock or internal clock.

Fig. 18. Serial I/O Block Diagram

Internal clock: The serial I/O counter is set to "7" during the write cycle into the serial I/O register (address 00DD16), and the transfer clock goes "H" forcibly. At each falling edge of the transfer clock after the write cycle, serial data is output from the SOUT pin. Transfer direction can be selected by bit 5 of the serial I/O mode register. At each rising edge of the transfer clock, data is input from the SIN pin and data in the serial I/O register is shifted 1 bit.

After the transfer clock has counted 8 times, the serial I/O counter becomes "0" and the transfer clock stops at HIGH. At this time the interrupt request bit is set to "1."

External clock: When an external clock is selected as the clock source, the interrupt request is set to "1" after the transfer clock has been counted 8 counts. However, transfer operation does not stop, so the clock should be controlled externally. Use the external clock of 1MHz or less with a duty cycle of 50%.

The serial I/O timing is shown in Figure 19. When using an external clock for transfer, the external clock must be held at HIGH for initializing the serial I/O counter. When switching between an internal clock and an external clock, do not switch during transfer. Also, be sure to initialize the serial I/O counter after switching.

**Notes 1:** On programming, note that the serial I/O counter is set by writing to the serial I/O register with the bit managing instructions, such as SEB and CLB.

**2:** When an external clock is used as the synchronous clock, write transmit data to the serial I/O register when the transfer clock input level is HIGH.

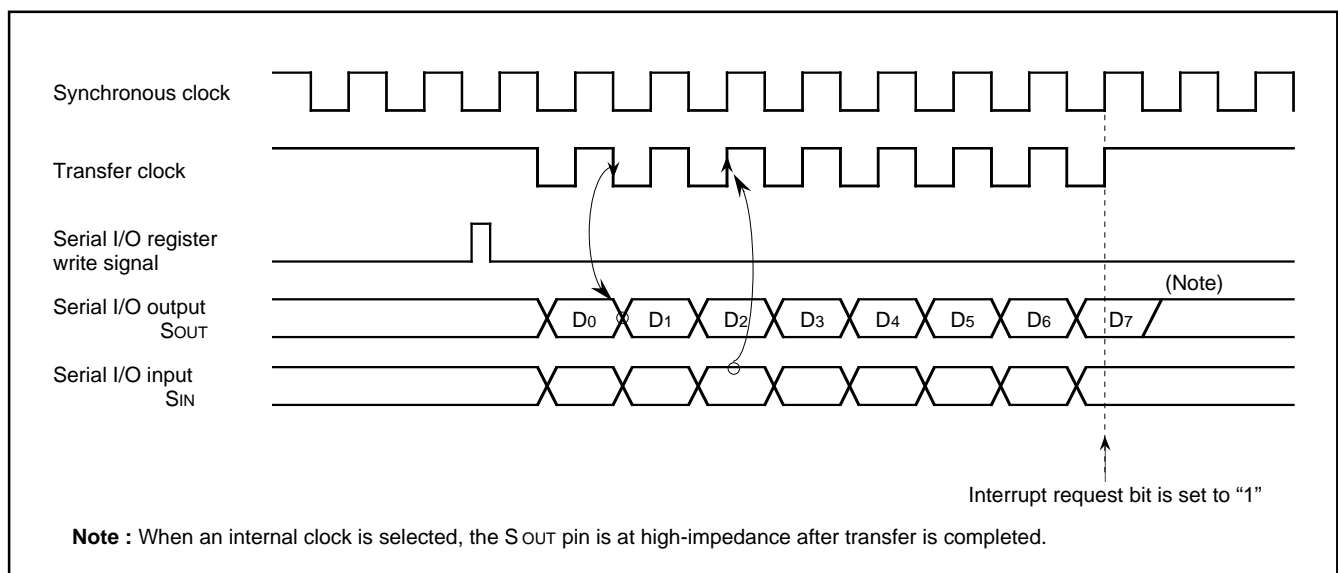

Fig. 19. Serial I/O Timing (for LSB first)

Serial I/O Mode Register

Fig. 20. Serial I/O Mode Register

**Serial I/O Common Transmission/Reception Mode**

By writing "1" to bit 6 of the serial I/O mode register, signals SIN and SOUT are switched internally to be able to transmit or receive the serial data.

Figure 21 shows signals on serial I/O common transmission/reception mode.

**Note:** When receiving the serial data after writing "FF16" to the serial I/O register.

Fig. 21. Signals on Serial I/O Common Transmission/Reception Mode

## PWM OUTPUT FUNCTION

The M37224M3-XXXSP is equipped with a 14-bit PWM (DA) and six 8-bit PWMs (PWM0–PWM5). DA has a 14-bit resolution with the minimum resolution bit width of  $0.25 \mu\text{s}$  and a repeat period of  $4096 \mu\text{s}$  (for  $f(X_{IN}) = 8 \text{ MHz}$ ). PWM0–PWM5 have the same circuit structure and an 8-bit resolution with minimum resolution bit width of  $4 \mu\text{s}$  and repeat period of  $1024 \mu\text{s}$  (for  $f(X_{IN}) = 8 \text{ MHz}$ ).

Figure 22 shows the PWM block diagram. The PWM timing generating circuit applies individual control signals to PWM0–PWM5 using  $f(X_{IN})$  divided by 2 as a reference signal.

### (1) Data Setting

When outputting DA, first set the high-order 8 bits to the DA-H register (address 00CE<sub>16</sub>), then the low-order 6 bits to the DA-L register (address 00CF<sub>16</sub>). When outputting PWM0–PWM5, set 8-bit output data to the PWM<sub>i</sub> register (i means 0 to 5; addresses 00D0<sub>16</sub> to 00D4<sub>16</sub>, 00F6<sub>16</sub>).

### (2) Transmitting Data from Register to PWM circuit

Data transfer from the 8-bit PWM register to the 8-bit PWM circuit is executed at writing data to the register.

The signal output from the 8-bit PWM output pin corresponds to the contents of this register.

Also, data transfer from the DA register (addresses 00CE<sub>16</sub> and 00CF<sub>16</sub>) to the 14-bit PWM circuit is executed at writing data to the DA-L register (address 00CF<sub>16</sub>). Reading from the DA-H register (address 00CE<sub>16</sub>) means reading this transferred data. Accordingly, it is possible to confirm the data being output from the D-A output pin by reading the DA register.

### (3) Operating of 8-bit PWM

The following explains PWM operation.

First, set the bit 0 of PWM output control register 1 (address 00D5<sub>16</sub>) to "0" (at reset, this bit 0 already set to "0" automatically), so that the PWM count source is supplied.

PWM0–PWM5 are also used as pins P0<sub>0</sub>–P0<sub>5</sub> respectively. For PWM0–PWM5, set the corresponding bits of the port P0 direction register to "1" (output mode). And select each output polarity by bit 3 of PWM output control register 2 (address 00D6<sub>16</sub>). Then, set bits 2 to 7 of PWM output control register 1 to "1" (PWM output).

The PWM waveform is output from the PWM output pins by setting these registers.

Figure 23 shows the 8-bit PWM timing. One cycle (T) is composed of 256 ( $2^8$ ) segments. The 8 kinds of pulses, relative to the weight of each bit (bits 0 to 7), are output inside the circuit during 1 cycle. Refer to Figure 23 (a). The 8-bit PWM outputs waveform performed a OR operation of pulses corresponding to the contents of bits 0 to 7 of the 8-bit PWM register. Several examples are shown in Figure 23 (b). 256 kinds of output (HIGH area: 0/256 to 255/256) are selected by changing the contents of the PWM register. A length of entirely HIGH cannot be output, i.e. 256/256.

### (4) Operating of 14-bit PWM

As with 8-bit PWM, set the bit 0 of the PWM output control register 1 (address 00D5<sub>16</sub>) to "0" (at reset, bit 0 is already set to "0" automatically), so that the PWM count source is supplied. Next, select the output polarity by bit 2 of PWM output control register 2 (address 00D6<sub>16</sub>). Then, the 14-bit PWM outputs from the D-A output pin by setting bit 1 of PWM output control register 1 to "0" (at reset, this bit already set to "0" automatically) to select the DA output.

The output example of the 14-bit PWM is shown in Figure 24.

The 14-bit PWM divides the data of the DA latch into the low-order 6 bits and the high-order 8 bits.

The fundamental waveform is determined with the high-order 8-bit data "DH." A "H" level area with a length  $\tau \times DH$  ("H" level area of fundamental waveform) is output every short area of " $t$ " =  $256\tau$  =  $64 \mu\text{s}$  ( $\tau$  is the minimum resolution bit width of  $0.25 \mu\text{s}$ ). The "H" level area increase interval ( $t_m$ ) is determined with the low-order 6-bit data "DL." The "H" level area of smaller intervals " $t_m$ " shown in Table 6 is longer by  $\tau$  than that of other smaller intervals in PWM repeat period " $T$ " = 64t. Thus, a rectangular waveform with the different "H" width is output from the D-A pin. Accordingly, the PWM output changes by  $\tau$  unit pulse width by changing the contents of the DA-H and DA-L registers. A length of entirely "H" output cannot be output, i. e. 256/256.

### (5) Output after Reset

At reset the output of port P0<sub>0</sub>–P0<sub>5</sub> is in the high-impedance state, and the contents of the PWM register and the PWM circuit are undefined. Note that after reset, the PWM output is undefined until setting the PWM register.

Table 2. Relation between Low-order 6-bit Data and High-level Area Increase Interval

Low-order 6 Bits of Data	Area Longer by $\tau$ than That of Other $t_m$ ( $m = 0$ to 63)
0 0 0 0 0 0 <sup>LSB</sup>	Nothing
0 0 0 0 0 1	$m = 32$
0 0 0 0 1 0	$m = 16, 48$
0 0 0 1 0 0	$m = 8, 24, 40, 56$
0 0 1 0 0 0	$m = 4, 12, 20, 28, 36, 44, 52, 60$
0 1 0 0 0 0	$m = 2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62$
1 0 0 0 0 0	$m = 1, 3, 5, 7, \dots, 57, 59, 61, 63$

Fig. 26. PWM Output Control Register 2

**A-D COMPARATOR**

A-D comparator consists of 6-bit D-A converter and comparator. A-D comparator block diagram is shown in Figure 27.

The reference voltage "V<sub>ref</sub>" for D-A conversion is set by bits 0 to 5 of the A-D control register 2 (address 00EF16).

The comparison result of the analog input voltage and the reference voltage "V<sub>ref</sub>" is stored in bit 4 of the A-D control register 1 (address 00EE16).

For A-D comparison, set "0" to corresponding bits of the direction register to use ports as analog input pins. Write the data for select of analog input pins to bits 0 to 2 of the A-D control register 1 and write the digital value corresponding to V<sub>ref</sub> to be compared to the bits 0 to 5 of the A-D control register 2. The voltage comparison starts by writing to the A-D control register 2, and it is completed after 16 machine cycles (NOP instruction X 8).

Table 3. Relation between Contents of A-D Control Register 2 and Reference Voltage "V<sub>ref</sub>"

A-D Control Register 2						Reference Voltage "V <sub>ref</sub> "

Fig. 29. A-D Control Register 2

**D-A CONVERTER**

The M37224M3-XXXSP has 2 D-A converters with 6-bit resolution. D-A converter block diagram is shown in Figure 30.

D-A conversion is performed by setting the value in the DA conversion register. The result of D-A conversion is output from the DA pin by setting "1" to the DA output enable bit of the port P3 output mode control register (bits 2 and 3 at address 00CD16).

The output analog voltage V is determined with the value n (n: decimal number) in the DA conversion register.

$$V = V_{CC} \times \frac{n}{128} \quad (n = 0 \text{ to } 127)$$

The DA output does not build in a buffer, so connect an external buffer when driving a low-impedance load.

Table 4. Relation between Contents of D-A Conversion Register and Output Voltage

D-A Conversion Register							Output Voltage "V"
Bit 7	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	
0	0	0	0	0	0	0	0/128 V <sub>CC</sub>

## CRT DISPLAY FUNCTIONS

### (1) Outline of CRT Display Functions

Table 5 outlines the CRT display functions of the M37224M3-XXXSP.

The M37224M3-XXXSP incorporates a CRT display circuit of 20 characters X 2 lines. CRT display is controlled by the CRT control register. Up to 128 kinds of characters can be displayed. The colors can be specified for each character and up to 4 kinds of colors can be displayed on one screen. A combination of up to 7 colors can be obtained by using each output signal (R, G, and B).

Characters are displayed in a 12 X 16 dots configuration to obtain smooth character patterns (refer to Figure 33).

The following shows the procedure how to display characters on the CRT screen.

- ① Write the display character code in the display RAM.
- ② Specify the display color by using the color register.
- ③ Write the color register in which the display color is set in the display RAM.
- ④ Specify the vertical position by using the vertical position register.
- ⑤ Specify the character size by using the character size register.
- ⑥ Specify the horizontal position by using the horizontal position register.
- ⑦ Write the display enable bit to the designated block display flag of the CRT control register. When this is done, the CRT display starts according to the input of the VSYNC signal.

The CRT display circuit has an extended display mode. This mode allows multiple lines (3 lines or more) to be displayed on the screen by interrupting the display each time one line is displayed and rewriting data in the block for which display is terminated by software.

Figure 34 shows the CRT display control register. Figure 35 shows the block diagram of the CRT display circuit.

Table 5. Outline of CRT Display Functions

Parameter		Functions
Number of display characters		20 characters X 2 lines
Dot structure		12 X 16 dots (refer to Figure 33)
Kinds of characters		128 kinds
Kinds of character sizes		3 kinds
Color	Kinds of colors	1 screen: 4 kinds, maximum 7 kinds
	Coloring unit	A character
Display expansion		Possible (multiline display)
Raster coloring		Possible (maximum 7 kinds)

Fig. 33. CRT Display Character Configuration

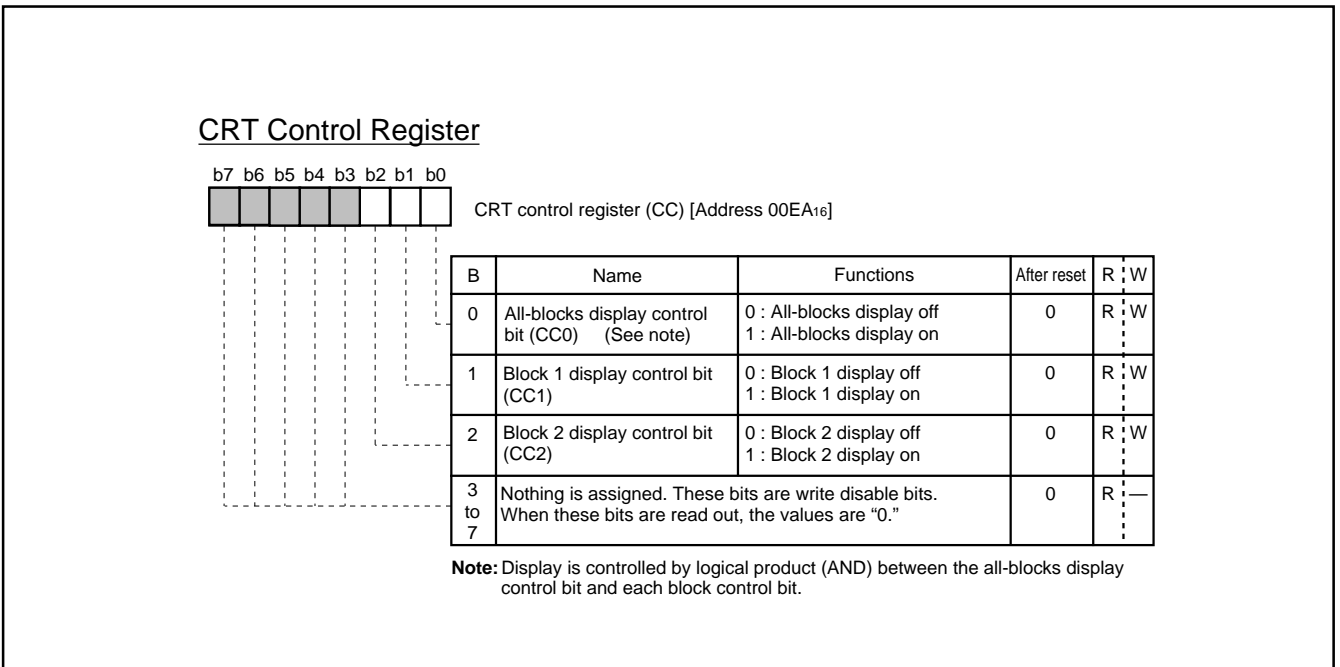

Fig. 34. CRT Control Register

Fig. 35. Block Diagram of CRT Display Circuit

**(2) Display Position**

The display positions of characters are specified in units called a "block." There are 2 blocks, block 1 and block 2. Up to 20 characters can be displayed in each block (refer to (4) Memory for Display).

The display position of each block can be set in both horizontal and vertical directions by software.

The display position in the horizontal direction can be selected for all blocks in common from 64-step display positions in units of 4Tc (Tc = oscillating cycle for display).

The display position in the vertical direction for each block can be selected from 128-step display positions in units of 4 scanning lines.

Block 2 is displayed after the display of block 1 is completed (refer to Figure 36 (a)). Accordingly, if the display of block 2 starts during the display of block 1, only block 1 is displayed. Similarly, when multiline display, block 1 is displayed after the display of block 2 is completed (refer to Figure 36 (b)).

The vertical position can be specified from 128-step positions (4 scanning lines per a step) for each block by setting values "0016" to "7F16" to bits 0 to 6 in the vertical position register (addresses 00E116 and 00E216). Figure 38 shows the structure of the vertical position register.

Fig. 36. Display Position

The display position in the vertical direction is determined by counting the horizontal sync signal (HSYNC). At this time when VSYNC and HSYNC are positive polarity (negative polarity), it starts to count the rising edge (falling edge) of HSYNC signal from after about 1 machine cycle of rising edge (falling edge) of VSYNC signal. So interval from rising edge (falling edge) of VSYNC signal to rising edge (falling edge) of HSYNC signal needs enough time (2 machine cycles or more) for avoiding jitter. The polarity of HSYNC and VSYNC signals can select with the CRT port control register (address 00EC16).

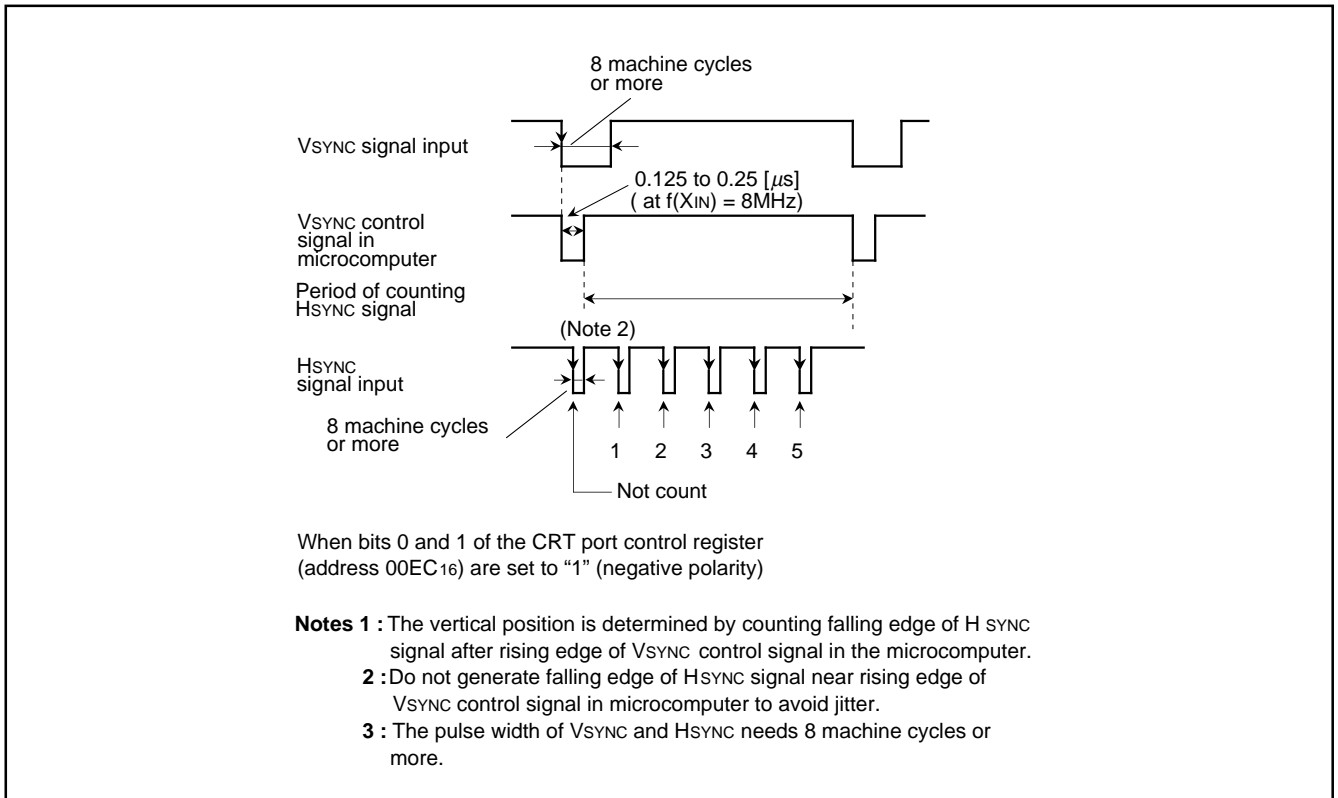

Fig. 37. Supplement Explanation for Display Position

Fig. 38. Vertical Position Register i

The horizontal position is common to all blocks, and can be set in 64 steps (where 1 step is 4Tc, Tc being the display oscillation period) as values "0016" to "3F16" in bits 0 to 5 of the horizontal position register (address 00E016). The structure of the horizontal position register is shown in Figure 39.

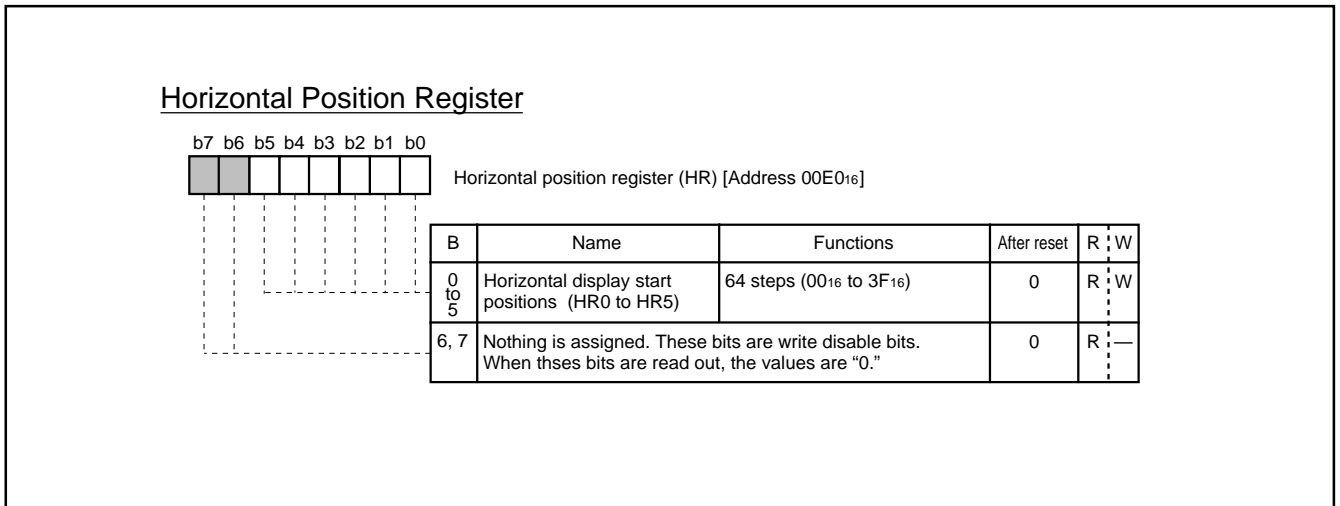

Fig. 39. Horizontal Position Register

### (3) Character Size

The size of characters to be displayed can be from 3 sizes for each block. Use the character size register (address 00E416) to set a character size. The character size of block 1 can be specified by using bits 0 and 1 of the character size register; the character size of block 2 can be specified by using bits 2 and 3. Figure 40 shows the character size register.

The character size can be selected from 3 sizes: minimum size, medium size and large size. Each character size is determined by the number of scanning lines in the height (vertical) direction and the oscillating cycle for display (Tc) in the width (horizontal) direction. The minimum size consists of [1 scanning line] X [1Tc]; the medium size consists of [2 scanning lines] X [2Tc]; and the large size consists of [3 scanning lines] X [3Tc]. Table 6 shows the relation between the set values in the character size register and the character sizes.

Fig. 41. Display Start Position of each Character Size (horizontal direction)

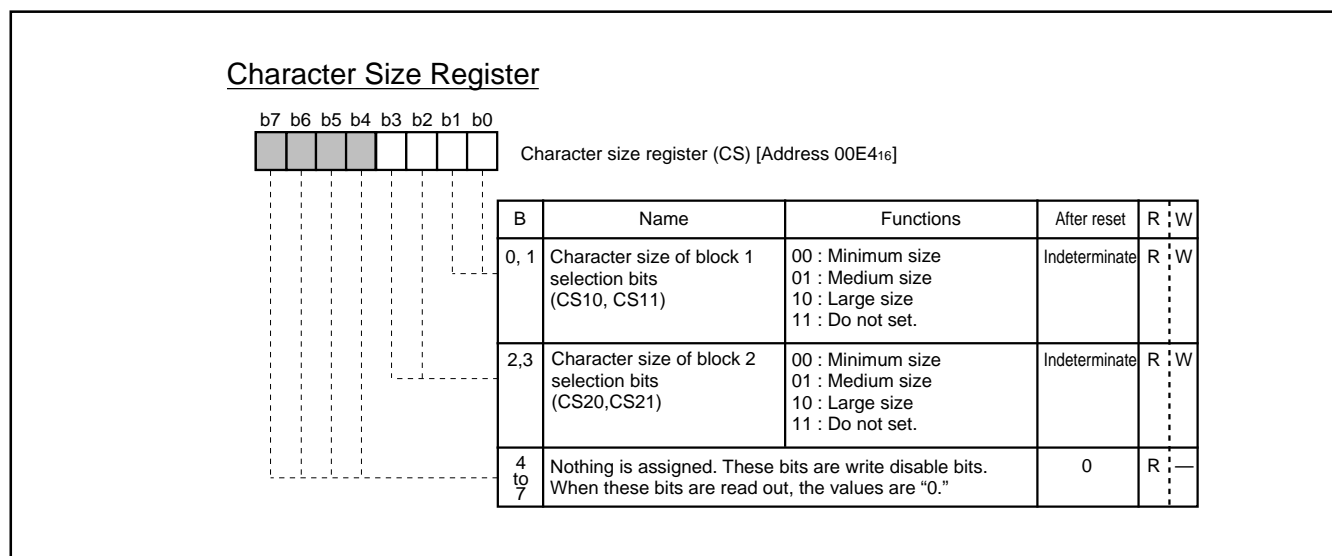

Fig. 40. Character Size Register

Table 6. Relation between Set Values in Character Size Register and Character Sizes

Set Values of Character Size Register		Character Size	Width (horizontal) Direction Tc: oscillating cycle for display	Height (vertical) Direction Scanning Lines
CSn1	CSn0			
0	0	Minimum	1Tc	1
0	1	Medium	2Tc	2
1	0	Large	3Tc	3
1	1	This is not available		

**Note:** The display start position in the horizontal direction is not affected by the character size. In other words, the horizontal display start position is common to all blocks even when the character size varies with each block (refer to Figure 41).

**(4) Memory for Display**

There are 2 types of display memory : CRT display ROM (addresses 10000<sub>16</sub> to 10FFF<sub>16</sub>) used to store character dot data (masked) and CRT display RAM (addresses 0600<sub>16</sub> to 06B3<sub>16</sub>) used to specify the colors of characters to be displayed. The following describes each type of display memory.

① ROM for display (addresses 10000<sub>16</sub> to 10FFF<sub>16</sub>)

The CRT display ROM contains dot pattern data for characters to be displayed. For characters stored in this ROM to be actually displayed, it is necessary to specify them by writing the character code inherent to each character (code determined based on the addresses in the CRT display ROM) into the CRT display RAM. The character code list is shown in Table 7.

The CRT display ROM has a capacity of 4 K bytes. Since 32 bytes are required for 1 character data, the ROM can store up to 128 kinds of characters.

The CRT display ROM space is broadly divided into 2 areas. The [vertical 16 dots] X [horizontal (left side) 8 dots] data of display characters are stored in addresses 10000<sub>16</sub> to 107FF<sub>16</sub>; the [vertical 16 dots] X [horizontal (right side) 4 dots] data of display characters are stored in addresses 10800<sub>16</sub> to 10FFF<sub>16</sub> (refer to Figure 42). Note however that the high-order 4 bits in the data to be written to addresses 10800<sub>16</sub> to 10FFF<sub>16</sub> must be set to "1" (by writing data "FX<sub>16</sub>").

Fig. 42. Display Character Stored Data

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

Table 7. Character Code List (partially abbreviated)

Character code	Character data storage address	
	Left 8 dots lines	Right 4 dots lines
00 <sub>16</sub>	1000 <sub>16</sub> to 100F <sub>16</sub>	1080 <sub>16</sub> to 108F <sub>16</sub>
01 <sub>16</sub>	10010 <sub>16</sub> to 1001F <sub>16</sub>	10810 <sub>16</sub> to 1081F <sub>16</sub>
02 <sub>16</sub>	10020 <sub>16</sub> to 1002F <sub>16</sub>	10820 <sub>16</sub> to 1082F <sub>16</sub>
03 <sub>16</sub>	10030 <sub>16</sub> to 1003F <sub>16</sub>	10830 <sub>16</sub> to 1083F <sub>16</sub>
:	:	:
7E <sub>16</sub>	107E0 <sub>16</sub> to 107EF <sub>16</sub>	10FE0 <sub>16</sub> to 10FEF <sub>16</sub>
7F <sub>16</sub>	107F0 <sub>16</sub> to 107FF <sub>16</sub>	10FF0 <sub>16</sub> to 10FFF <sub>16</sub>

② RAM for display (addresses 0600<sub>16</sub> to 06B3<sub>16</sub>)

The CRT display RAM is allocated at addresses 0600<sub>16</sub> to 06B3<sub>16</sub>, and is divided into a display character code specification part and display color specification part for each block. Table 8 shows the contents of the CRT display RAM.

For example, to display 1 character position (the left edge) in block 1, write the character code in address 0600<sub>16</sub> and write the color register No. to the low-order 2 bits (bits 0 and 1) in address 0680<sub>16</sub>. The color register No. to be written here is one of the 4 color registers in which the color to be displayed is set in advance. For details on color registers, refer to (5) Color Registers. The structure of the CRT display RAM is shown in Figure 43.

Table 8. Contents of CRT Display RAM

Block	Display Position (from left)	Character Code Specification	Color Specification
Block 1	1st character	0600 <sub>16</sub>	0680 <sub>16</sub>
	2nd character	0601 <sub>16</sub>	0681 <sub>16</sub>
	3rd character	0602 <sub>16</sub>	0682 <sub>16</sub>
	:	:	:
	18th character	0611 <sub>16</sub>	0691 <sub>16</sub>
	19th character	0612 <sub>16</sub>	0692 <sub>16</sub>
Not used		0613 <sub>16</sub>	0693 <sub>16</sub>
		0614 <sub>16</sub> to 061F <sub>16</sub>	0694 <sub>16</sub> to 069F <sub>16</sub>
Block 2	1st character	0620 <sub>16</sub>	06A0 <sub>16</sub>
	2nd character	0621 <sub>16</sub>	06A1 <sub>16</sub>
	3rd character	0622 <sub>16</sub>	06A2 <sub>16</sub>
	:	:	:
	18th character	0631 <sub>16</sub>	06B1 <sub>16</sub>
	19th character	0632 <sub>16</sub>	06B2 <sub>16</sub>
	20th character	0633 <sub>16</sub>	06B3 <sub>16</sub>

Fig. 43. Structure of CRT Display RAM

**(5) Color Registers**

The color of a displayed character can be specified by setting the color to one of the 4 registers (CO0 to CO3: addresses 00E6<sub>16</sub> to 00E9<sub>16</sub>) and then specifying that color register with the CRT display RAM. There are 3 color outputs; R, G and B. By using a combination of these outputs, it is possible to set 2<sup>3</sup>-1 (when no output) = 7 colors. However, since only 4 color registers are available, up to 4 colors can be disabled at one time.

R, G and B outputs are set by using bits 1 to 3 in the color register. Bit 5 is used to specify whether a character output or blank output. Figure 44 shows the color register.

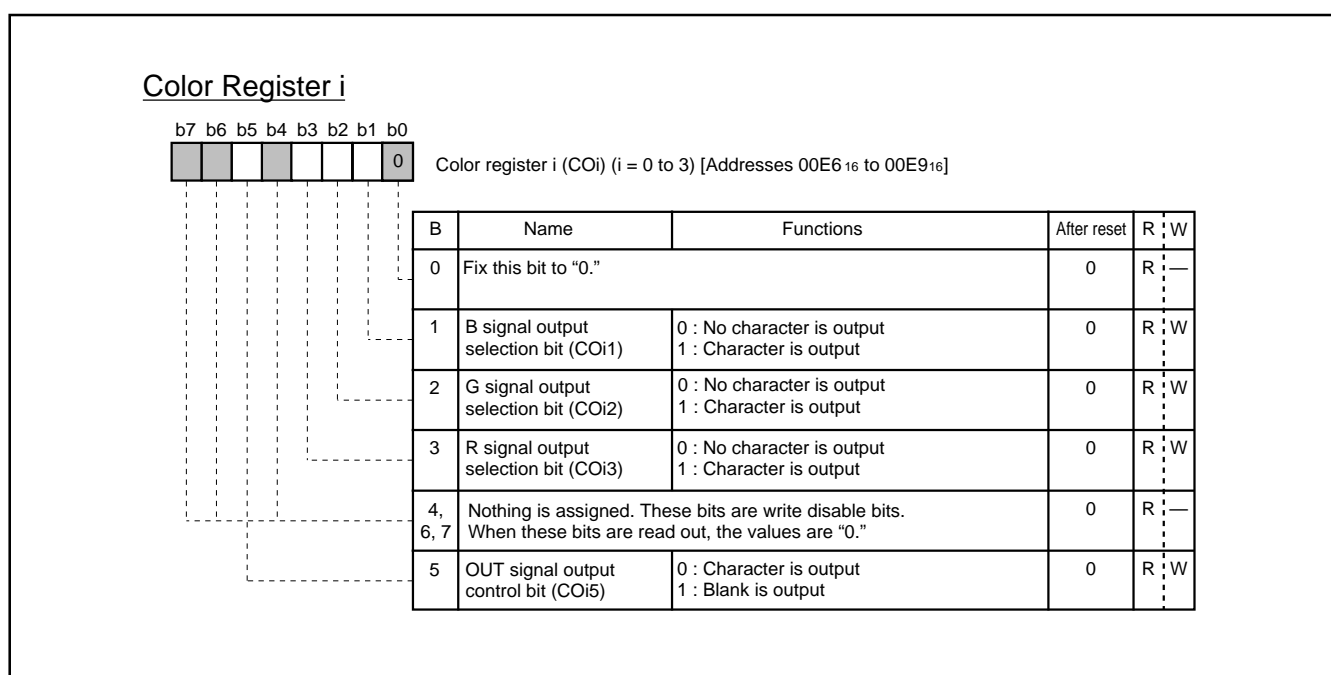

Fig. 44. Color Registers

**(6) Character Border Function**

An border of 1 clock (1 dot) equivalent size can be added to a character to be displayed in both horizontal and vertical directions. The border is output from the OUT pin. In this case, set bit 5 of a color register to "0" (character is output).

Border can be specified in units of block by using the border selection register (address 00E516). Figure 45 shows the border selection register. Table 9 shows the relationship between the values set in the border selection register and the character border function.

Fig. 46. Example of Border

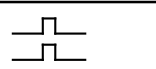

**Border Selection Register**

b7 b6 b5 b4 b3 b2 b1 b0  
 Border selection register (MD) [Address 00E516]

B	Name	Functions	After reset	R   W
0	Block 1 OUT output border selection bit (MD10)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R   W
1	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R   —
2	Block 2 OUT output border selection bit (MD20)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R   W
3 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R   —

Fig. 45. Border Selection Register

Table 9. Relationship between Set Value in Border Selection Register and Character Border Function

Border Selection Register MDn0	Functions	Example of Output
0	Ordinary	R, G, B output OUT output 
1	Border including character	R, G, B output OUT output 

**(7) Multiline Display**

The M37224M3-XXXSP can ordinarily display 2 lines on the CRT screen by displaying 2 blocks at different vertical positions. In addition, it can display up to 16 lines by using CRT interrupts.

A CRT interrupt request occurs at the point at which display of each block has been completed. In other words, when a scanning line reaches the point of the display position (specified by the vertical position registers) of a certain block, the character display of that block starts, and an interrupt occurs at the point at which the scanning line exceeds the block.

**Note:** A CRT interrupt does not occur at the end of display when the block is not displayed. In other words, if a block is set to off display with the display control bit of the CRT control register (address 00EA16), a CRT interrupt request does not occur (refer to Figure 47).

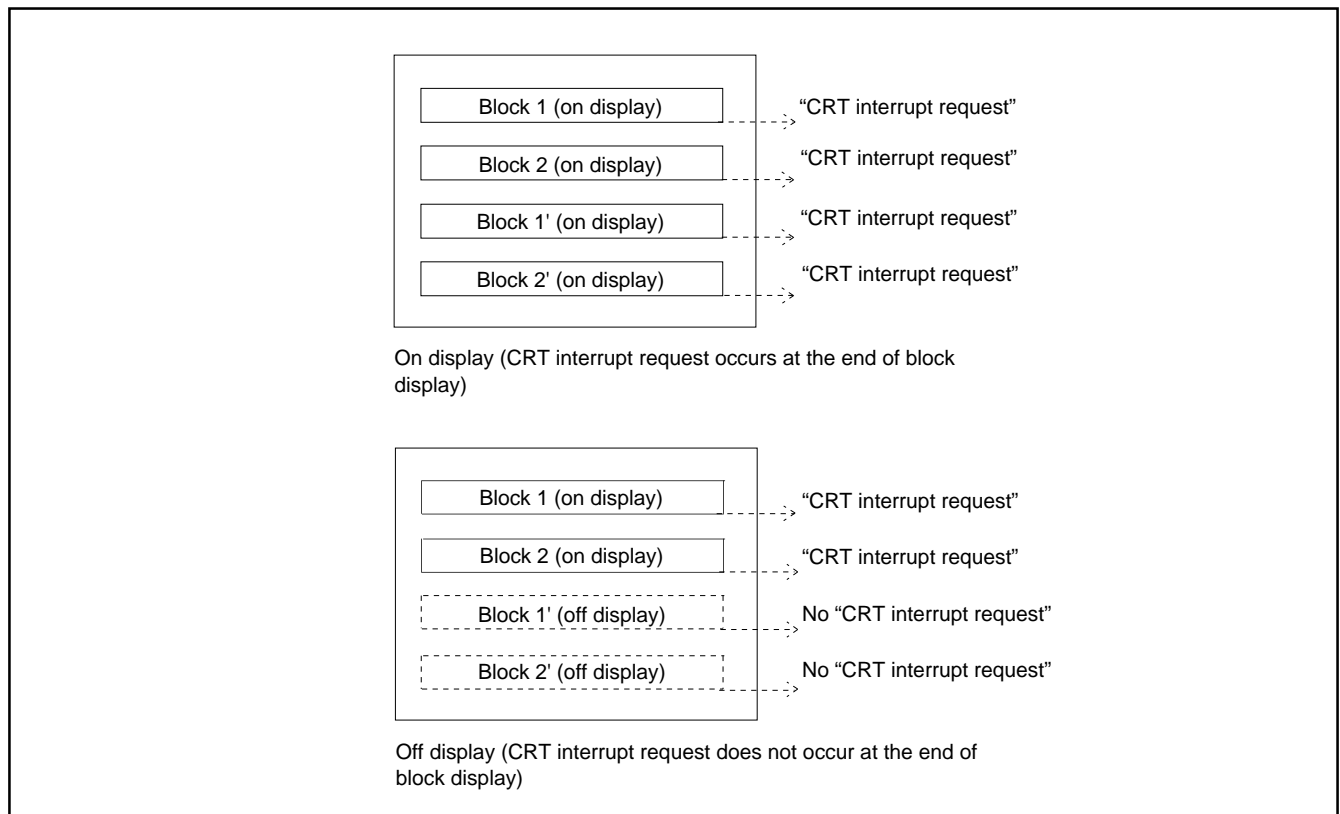

Fig. 47. Timing of CRT Interrupt Request

**(8) CRT Output Pin Control**

The CRT output pins R, G, B, and OUT can also function as ports P52, P53, P54 and P55. Set the corresponding bit of the port P5 direction register (address 00CB16) to "0" to specify these pins as CRT output pins, or set it to "1" to specify it as an general-purpose port P5 pins.

The input polarity of signals HSYNC and VSYNC and output polarity of signals R, G, B, and OUT can be specified with the bits of the CRT port control register (address 00EC16) . Set a bit to "0" to specify positive polarity; set it to "1" to specify negative polarity. The structure of the CRT port control register is shown in Figure 48.

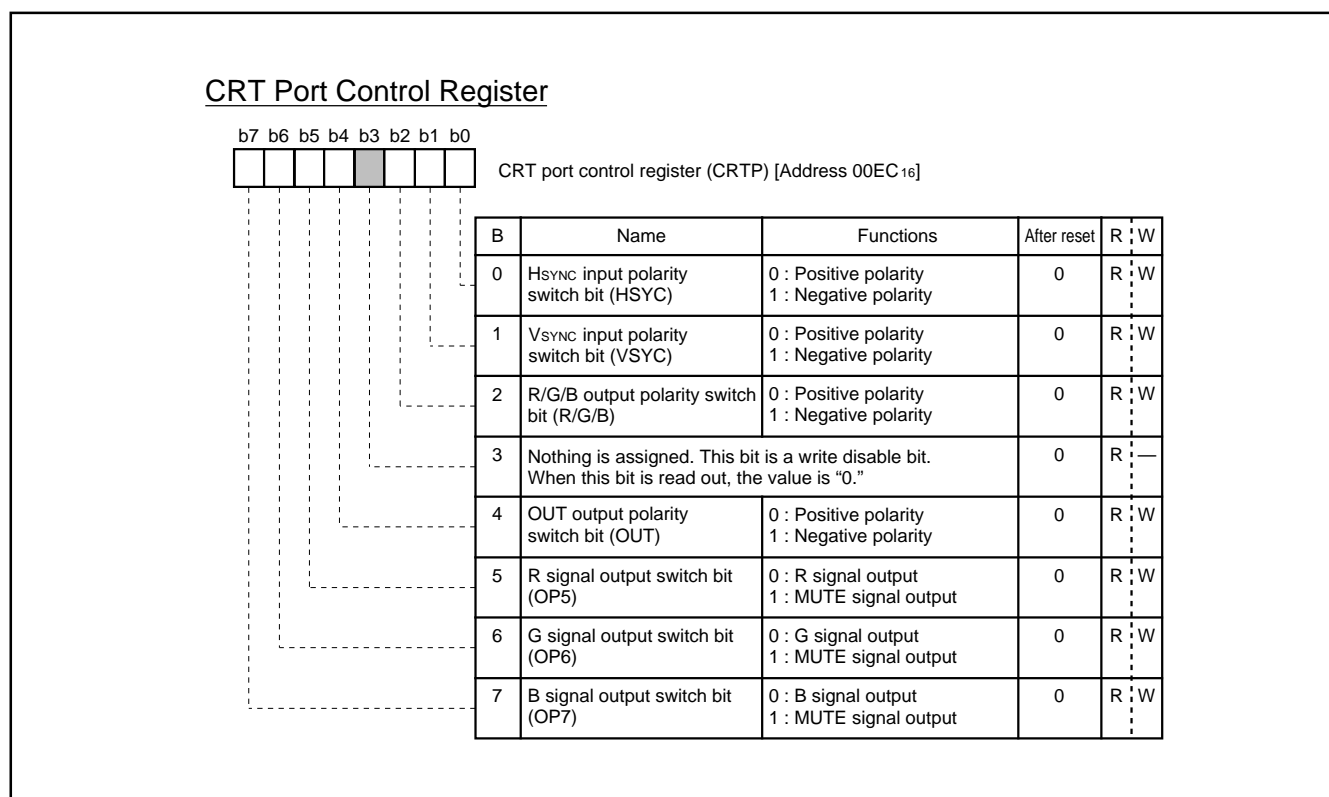

Fig. 48. CRT Port Control Register

**(9) Raster Coloring Function**

An entire screen (raster) can be colored by setting the bits 5 to 7 of the CRT port control register. Since each of the R, G, and B pins can be switched to raster coloring output, 7 raster colors can be obtained. If the R, G, and B pins have been set to MUTE signal output, a raster coloring signal is output in the part except a no-raster colored character (in Figure 49, a character "O") during 1 horizontal scanning period. This ensures that character colors do not mix with the raster color. In this case, MUTE signal is output from the OUT1 pin. An example in which a magenta character "I" and a red character "O" are displayed with blue raster coloring is shown in Figure 49.

Fig. 49. Example of Raster Coloring

**(10) Clock for Display**

As a clock for display to be used for CRT display, it is possible to select one of the following 4 types.

- Main clock supplied from the X<sub>IN</sub> pin
- Main clock supplied from the X<sub>IN</sub> pin divided by 1.5
- Clock from the LC or RC supplied from the pins OSC1 and OSC2.
- Clock from the ceramic resonator or quartz-crystal oscillator supplied from the pins OSC1 and OSC2.

This clock for display can be selected for each block by the CRT clock selection register (address 00ED<sub>16</sub>).

When selecting the main clock, set the oscillation frequency to 8 MHz.

Fig. 50. CRT Clock Selection Register

### ROM CORRECTION FUNCTION

This can correct program data in ROM. Up to 2 addresses (2 blocks) can be corrected, a program for correction is stored in the ROM correction memory in RAM. The ROM memory for correction is 32 bytes X 2 blocks.

Block 1 : addresses 02C0<sub>16</sub> to 02DF<sub>16</sub>

Block 2 : addresses 02E0<sub>16</sub> to 02FF<sub>16</sub>

Set the address of the ROM data to be corrected into the ROM correction address register. When the value of the counter matches the ROM data address in the ROM correction address, the main program branches to the correction program stored in the ROM memory for correction. To return from the correction program to the main program, the op code and operand of the JMP instruction (total of 3 bytes) are necessary at the end of the correction program. When the blocks 1 and 2 are used in series, the above instruction is not needed at the end of the block 1.

The ROM correction function is controlled by the ROM correction enable register.

**Notes 1 :** Specify the first address (op code address) of each instruction as the ROM correction address.

**2 :** Use the JMP instruction (total of 3 bytes) to return from the main program to the correction program.

**3 :** Do not set the same ROM correction address to the blocks 1 and 2.

Fig. 51. ROM Correction Address Registers

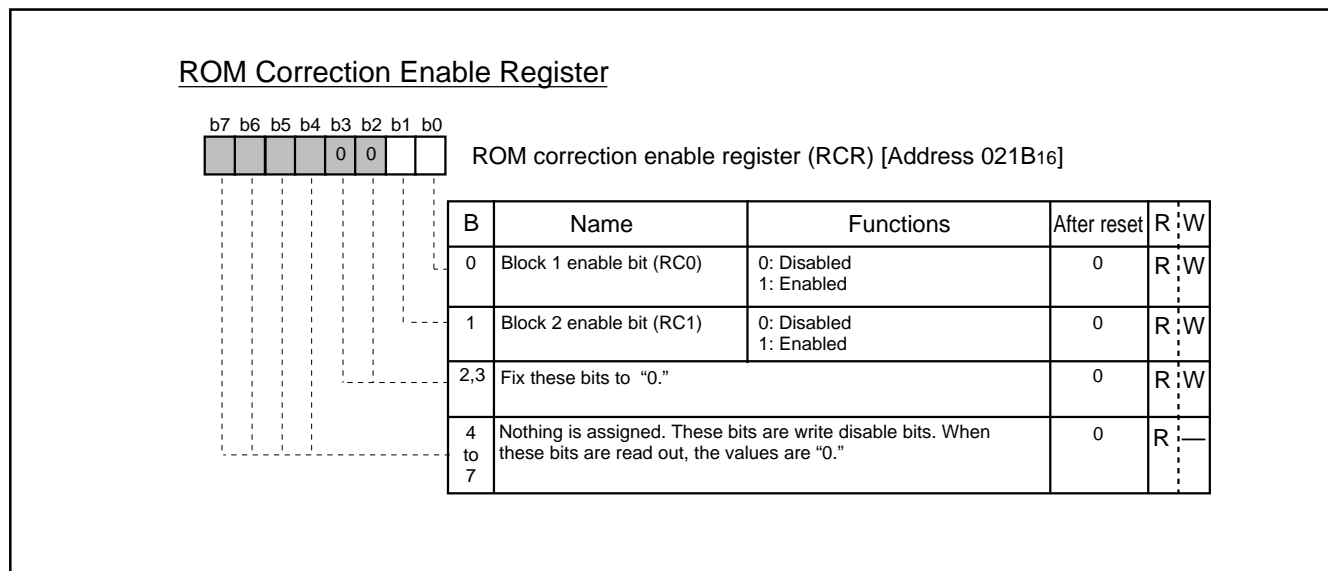

Fig. 52. ROM Correction Enable Register

**RESET CIRCUIT**

When the oscillation of a quartz-crystal oscillator or a ceramic resonator is stable and the power source voltage is  $5\text{ V} \pm 10\%$ , hold the RESET pin at LOW for  $2\ \mu\text{s}$  or more, then return it to HIGH. Then, as shown in Figure 53, reset is released and the program starts from the address formed by using the content of address  $\text{FFFF}_{16}$  as the high-order address and the content of the address  $\text{FFFE}_{16}$  as the

low-order address. The internal state of microcomputer at reset are shown in Figures 5 to 8.

An example of the reset circuit is shown in Figure 53.

The reset input voltage must be kept 0.6 V or less until the power source voltage surpasses 4.5 V.

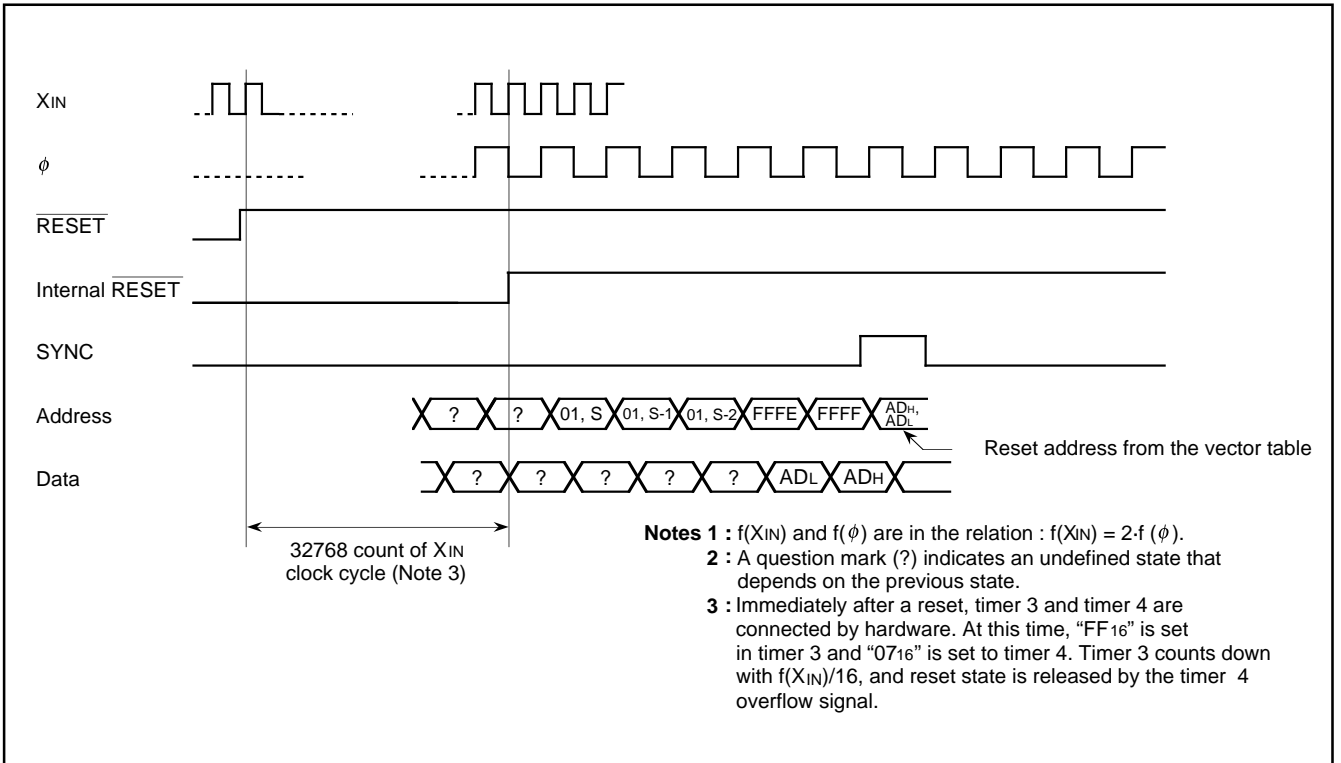

Fig. 53. Reset Sequence

Fig. 54. Example of Reset Circuit

**CLOCK GENERATING CIRCUIT**

The built-in clock generating circuit is shown in Figure 57. When the STP instruction is executed, the internal clock  $\phi$  stops at HIGH. At the same time, timers 3 and 4 are connected by hardware and "FF16" is set in timer 3 and "0716" is set in the timer 4. Select  $f(X_{IN})/16$  as the timer 3 count source (set bit 0 of the timer 34 mode register to "0" before the execution of the STP instruction). Moreover, set the timer 3 and timer 4 interrupt enable bits to disabled ("0") before execution of the STP instruction). The oscillator restarts when external interrupt is accepted. However, the internal clock  $\phi$  keeps its HIGH until timer 4 overflows, allowing time for oscillation stabilization when a ceramic resonator or a quartz-crystal oscillator is used.

When the WIT instruction is executed, the internal clock  $\phi$  stops in the HIGH but the oscillator continues running. This wait state is released when an interrupt is accepted (Note). Since the oscillator does not stop, the next instruction can be executed at once.

When returning from the stop or the wait state, to accept an interrupt, set the corresponding interrupt enable bit to "1" before executing the STP or the WIT instructions.

**Note:** In the wait mode, the following interrupts are invalid.

- (1) VSYNC interrupt
- (2) CRT interrupt
- (3)  $f(X_{IN})/4096$  interrupt
- (4) Timer 1 interrupt using  $f(X_{IN})/4096$  as count source
- (5) Timer 2 interrupt using P24/TIM2 pin input as count source
- (6) Timer 3 interrupt using P23/TIM3 pin input as count source
- (7) Timer 4 interrupt using  $f(X_{IN})/2$  as count source
- (8) Multi-master I<sup>2</sup>C-BUS interface interrupt

A circuit example using a ceramic resonator (or a quartz-crystal oscillator) is shown in Figure 55. Use the circuit constants in accordance with the resonator manufacture's recommended values. A circuit example with external clock input is shown in Figure 56. Input the clock to the X<sub>IN</sub> pin, and open the X<sub>OUT</sub> pin.

Fig. 55. Ceramic Resonator Circuit Example

Fig. 56. External Clock Input Circuit Example

Fig. 57. Clock Generating Circuit Block Diagram

**DISPLAY OSCILLATION CIRCUIT**

The CRT display clock oscillation circuit has a built-in clock oscillation circuits, so that a clock for CRT display can be obtained simply by connecting an LC, an RC, a ceramic resonator or a quartz-crystal oscillator circuit across the pins OSC 1 and OSC 2. Select the clock for display with bits 0 and 1 of the CRT clock selection register (address 00ED16).

Fig. 58. Display Oscillation Circuit

**AUTO-CLEAR CIRCUIT**

When a power source is supplied, the auto-clear function will operate by connecting the following circuit to the RESET pin.

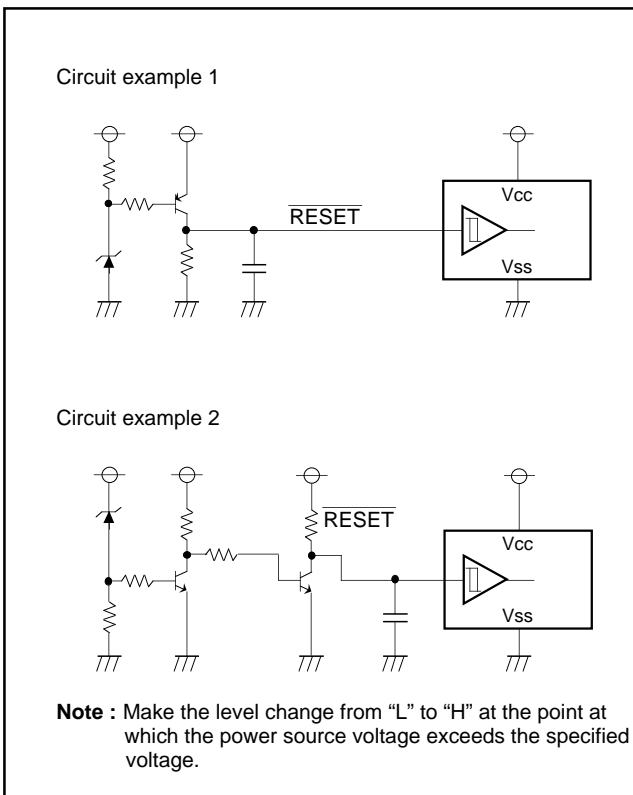

Fig. 59. Auto-clear Circuit Example

**ADDRESSING MODE**

The memory access is reinforced with 17 kinds of addressing modes. Refer to SERIES 740 <Software> User's Manual for details.

**MACHINE INSTRUCTIONS**

There are 71 machine instructions. Refer to SERIES 740 <Software> User's Manual for details.

**PROGRAMMING NOTES**

- (1) The divide ratio of the timer is  $1/(n+1)$ .
- (2) Even though the BBC and BBS instructions are executed immediately after the interrupt request bits are modified (by the program), those instructions are only valid for the contents before the modification. At least one instruction cycle is needed (such as an NOP) between the modification of the interrupt request bits and the execution of the BBC and BBS instructions.
- (3) After the ADC and SBC instructions are executed (in the decimal mode), one instruction cycle (such as an NOP) is needed before the SEC, CLC, or CLD instruction is executed.
- (4) An NOP instruction is needed immediately after the execution of a PLP instruction.
- (5) In order to avoid noise and latch-up, connect a bypass capacitor ( $\approx 0.1 \mu\text{F}$ ) directly between the Vcc pin-Vss pin and the Vcc pin-CNvss pin, using a thick wire.

**DATA REQUIRED FOR MASK ORDERS**

The following are necessary when ordering a mask ROM production:

- (1) Mask ROM Order Confirmation Form.
- (2) Mask Specification Form.
- (3) Data to be written to ROM, in EPROM form (32-pin DIP Type 27C101, three identical copies).

## 740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M37224M3-XXXSP MITSUBISHI ELECTRIC

Mask ROM number	
-----------------	--

Receipt	Date :	
	Section head signature	Supervisor signature

Note : Please fill in all items marked \*.

* Customer	Company name	TEL ( )	Issuance signature	Submitted by	Supervisor
	Date issued	Date :			

\* 1. Confirmation

Specify the name of the product being ordered and the type of EPROMs submitted.

Three EPROMs are required for each pattern.

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

Checksum code for entire EPROM 

--	--	--	--

 (hexadecimal notation)

EPROM type (indicate the type used)

<input type="checkbox"/> <b>27C101</b>	
EPROM address	
0000 <sub>16</sub>	Product name ASCII code : 'M37224M3 -'
000F <sub>16</sub>	
D000 <sub>16</sub>	data
FFFF <sub>16</sub>	ROM 12K bytes
10000 <sub>16</sub>	Character ROM 1
107FF <sub>16</sub>	Character ROM 2
10800 <sub>16</sub>	
10FFF <sub>16</sub>	
11000 <sub>16</sub>	
1FFFF <sub>16</sub>	

- (1) Set "FF<sub>16</sub>" in the shaded area.
- (2) Write the ASCII codes that indicate the product name of "M37220M3-" to addresses 0000<sub>16</sub> to 000F<sub>16</sub>.

EPROM data check item (confirm the EPROM data and check "✓" the appropriate box)

- Is "FF<sub>16</sub>" in the shaded area ? → Yes
- Are the ASCII codes that indicates the product name of "M37224M3-" to addresses 0000<sub>16</sub> to 000F<sub>16</sub> ? → Yes

\* 2. Mark specification

Mark specification must be submitted using the correct form for the type of package being ordered. Fill out the appropriate mark specification form (42P4B for M37224M3-XXXSP) and attach to the mask ROM confirmation form.

\* 3. Comments

(1/3)

## 740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M37224M3-XXXSP MITSUBISHI ELECTRIC

### How to Write the Product Name and Character ROM Data onto EPROMs

Addresses 0000<sub>16</sub> to 000F<sub>16</sub> store the product name, and addresses 10000<sub>16</sub> to 10FFF<sub>16</sub> store the character pattern. If the name of the product contained in the EPROMs does not match the name on the mask ROM confirmation form, the ROM processing is disabled. Please make sure the data is written correctly.

- How to input the name of the product with the ASCII code  
ASCII codes 'M37224M3-' are listed on the right.  
The addresses and data are in hexadecimal notation.

Address		Address	
0000 <sub>16</sub>	'M' = 4 D <sub>16</sub>	0008 <sub>16</sub>	'-' = 2 D <sub>16</sub>
0001 <sub>16</sub>	'3' = 3 3 <sub>16</sub>	0009 <sub>16</sub>	FF <sub>16</sub>
0002 <sub>16</sub>	'7' = 3 7 <sub>16</sub>	000A <sub>16</sub>	FF <sub>16</sub>
0003 <sub>16</sub>	'2' = 3 2 <sub>16</sub>	000B <sub>16</sub>	FF <sub>16</sub>
0004 <sub>16</sub>	'2' = 3 2 <sub>16</sub>	000C <sub>16</sub>	FF <sub>16</sub>
0005 <sub>16</sub>	'4' = 3 4 <sub>16</sub>	000D <sub>16</sub>	FF <sub>16</sub>
0006 <sub>16</sub>	'M' = 4 D <sub>16</sub>	000E <sub>16</sub>	FF <sub>16</sub>
0007 <sub>16</sub>	'3' = 3 3 <sub>16</sub>	000F <sub>16</sub>	FF <sub>16</sub>

- Inputting the character ROM  
Input the character ROM data by dividing it into character ROM1 and character ROM2. For the character ROM data, see the next page and on.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

**42P4B (42-PIN SHRINK DIP) MARK SPECIFICATION FORM**

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

**A. Standard Mitsubishi Mark**

**B. Customer's Parts Number + Mitsubishi Catalog Name**

Note 1: The mark field should be written right aligned.

2: The fonts and size of characters are standard Mitsubishi type.

3: Customer's parts number can be up to 15 characters:

Only 0~9, A~Z, +, -, /, (, ), &, ©, . (period), and , (comma) are usable.

4: If the Mitsubishi logo is not required, check the box on the right.

Mitsubishi logo is not required

**C. Special Mark Required**

Note 1: If the special mark is to be printed, indicate the desired layout of the mark in the upper figure. The layout will be duplicated as close as possible. Mitsubishi lot number (6-digit or 7-digit) and mask ROM number (3-digit) are always marked.

2: If the customer's trade mark logo must be used in the special mark, check the box below. Please submit a clean original of the logo.

For the new special character fonts a clean font original (ideally logo drawing) must be submitted.

Special logo required

The standard Mitsubishi font is used for all characters except for a logo.

PWM output control register 1 (PW) [Address 00D516]

B	Name	Functions	After reset	R	W
0	DA, PWM count source selection bit (PW0)	0 : Count source supply 1 : Count source stop	0	R	W
1	DA/PN4 output selection bit (PW1)	0 : DA output 1 : PN4 output	0	R	W
2	P00/PWM0 output selection bit (PW2)	0: P00 output 1: PWM0 output	0	R	W
3	P01/PWM1 output selection bit (PW3)	0: P01 output 1: PWM1 output	0	R	W
4	P02/PWM2 output selection bit (PW4)	0: P02 output 1: PWM2 output	0	R	W
5	P03/PWM3 output selection bit (PW5)	0: P03 output 1: PWM3 output	0	R	W
6	P04/PWM4 output selection bit (PW6)	0: P04 output 1: PWM4 output	0	R	W
7	P05/PWM5 output selection bit (PW7)	0: P05 output 1: PWM5 output	0	R	W

PWM Output Control Register 1

**Address 00D516**

PWM Output Control Register 2

PWM output control register 2 (PN) [Address 00D616]

B	Name	Functions	After reset	R	W
0, 1	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—
2	DA output polarity selection bit (PN3)	0 : Positive polarity 1 : Negative polarity	0	R	W
3	PWM output polarity selection bit (PN4)	0 : Positive polarity 1 : Negative polarity	0	R	W
4	DA general-purpose output bit (PN5)	0 : Output LOW 1 : Output HIGH	0	R	W
5 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

PWM Output Control Register 2

**Address 00D616**

# M37224M3-XXXSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### Serial I/O Mode Register

Serial I/O mode register (SM) [Address 00DC16]

B	Name	Functions	After reset	R : W
0, 1	Internal synchronous clock selection bits (SM0, SM1)	b1 b0 0 0: f(XIN)/4 0 1: f(XIN)/16 1 0: f(XIN)/32 1 1: f(XIN)/64	0	R : W
2	Synchronous clock selection bit (SM2)	0: External clock 1: Internal clock	0	R : W
3	Serial I/O port selection bit (SM3)	0: P20, P21 functions as port 1: SCLK, SOUT	0	R : W
4	Fix this bit to "0."		0	R : W
5	Transfer direction selection bit (SM5)	0: LSB first 1: MSB first	0	R : W
6	Serial input pin selection bit (SM6)	0: Input signal from SIN pin 1: Input signal from SOUT pin	0	R : W
7	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R : —

Serial I/O Mode Register

**Address 00DC16**

### DAi Conversion Register

DAi conversion register (DAi) (i = 1 and 2) [Address 00DE16, 00DF16]

B	Name	Functions	After reset	R : W
0 to 5, 7	DA conversion set bits (DAi0 to DAi5)	b7 b5 b4 b3 b2 b1 b0 0 0 0 0 0 0 0 0: 0/128Vcc 1 0 0 0 0 0 0 1: 1/128Vcc 0 0 0 0 0 0 1 0: 2/128Vcc ⋮ 1 1 1 1 1 1 0: 125/128Vcc 0 1 1 1 1 1 1: 126/128Vcc 1 1 1 1 1 1 1: 127/128Vcc	Indeterminate	R : W
6	Fix this bit to "0."		0	R : W

DAi Conversion Register

**Addresses 00DE16, 00DF16**

# M37224M3-XXXSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## Horizontal Position Register

Horizontal position register (HR) [Address 00E0<sub>16</sub>]

B	Name	Functions	After reset	R ; W
0 to 5	Horizontal display start positions (HR0 to HR5)	64 steps (00 <sub>16</sub> to 3F <sub>16</sub> )	0	R ; W
6, 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R ; —

Horizontal Position Register

**Address 00E0<sub>16</sub>**

## Vertical Position Register i

Vertical position register i (CVi) (i = 1 and 2) [Addresses 00E1<sub>16</sub>, 00E2<sub>16</sub>]

B	Name	Functions	After reset	R ; W
0 to 6	Vertical display start positions (CVi : CVi0 to CVi6)	128 steps (00 <sub>16</sub> to 7F <sub>16</sub> )	Indeterminate	R ; W
7	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R ; —

Vertical Position Register i

**Address 00E1<sub>16</sub>, 00E2<sub>16</sub>**

## Character Size Register

Character size register (CS) [Address 00E4<sub>16</sub>]

B	Name	Functions	After reset	R ; W
0, 1	Character size of block 1 selection bits (CS10, CS11)	00 : Minimum size 01 : Medium size 10 : Large size 11 : Do not set.	Indeterminate	R ; W
2, 3	Character size of block 2 selection bits (CS20, CS21)	00 : Minimum size 01 : Medium size 10 : Large size 11 : Do not set.	Indeterminate	R ; W
4 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R ; —

Character Size Register

**Address 00E4<sub>16</sub>**

**Border Selection Register**

Border selection register (MD) [Address 00E5<sub>16</sub>]

B	Name	Functions	After reset	R ; W
0	Block 1 OUT output border selection bit (MD10)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R ; W
1	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R ; —
2	Block 2 OUT output border selection bit (MD20)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R ; W
3 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R ; —

Border Selection Register

**Address 00E5<sub>16</sub>**

**Color Register i**

Color register i (CO<sub>i</sub>) (i = 0 to 3) [Addresses 00E6<sub>16</sub> to 00E9<sub>16</sub>]

B	Name	Functions	After reset	R ; W
0	Fix this bit to "0."		0	R ; —
1	B signal output selection bit (CO <sub>i</sub> 1)	0 : No character is output 1 : Character is output	0	R ; W
2	G signal output selection bit (CO <sub>i</sub> 2)	0 : No character is output 1 : Character is output	0	R ; W
3	R signal output selection bit (CO <sub>i</sub> 3)	0 : No character is output 1 : Character is output	0	R ; W
4, 6, 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R ; —
5	OUT signal output control bit (CO <sub>i</sub> 5)	0 : Character is output 1 : Blank is output	0	R ; W

Color Register i

**Addresses 00E6<sub>16</sub> to 00E9<sub>16</sub>**

**CRT Control Register**

CRT control register (CC) [Address 00EA<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	All-blocks display control bit (CC0) (See note)	0 : All-blocks display off 1 : All-blocks display on	0	R	W
1	Block 1 display control bit (CC1)	0 : Block 1 display off 1 : Block 1 display on	0	R	W
2	Block 2 display control bit (CC2)	0 : Block 2 display off 1 : Block 2 display on	0	R	W
3 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

**Note:** Display is controlled by logical product (AND) between the all-blocks display control bit and each block control bit.

CRT Control Register

**Address 00EA<sub>16</sub>**

**CRT Port Control Register**

CRT port control register (CRTP) [Address 00EC<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	H <sub>sync</sub> input polarity switch bit (HSYC)	0 : Positive polarity 1 : Negative polarity	0	R	W
1	V <sub>sync</sub> input polarity switch bit (VSYC)	0 : Positive polarity 1 : Negative polarity	0	R	W
2	R/G/B output polarity switch bit (R/G/B)	0 : Positive polarity 1 : Negative polarity	0	R	W
3	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R	—
4	OUT output polarity switch bit (OUT)	0 : Positive polarity 1 : Negative polarity	0	R	W
5	R signal output switch bit (OP5)	0 : R signal output 1 : MUTE signal output	0	R	W
6	G signal output switch bit (OP6)	0 : G signal output 1 : MUTE signal output	0	R	W
7	B signal output switch bit (OP7)	0 : B signal output 1 : MUTE signal output	0	R	W

CRT Port Control Register

**Address 00EC<sub>16</sub>**

**CRT Clock Selection Register**

CRT clock selection register (CK) [Address 00ED<sub>16</sub>]

B	Name	Functions	After reset	R	W		
0, 1	CRT clock selection bits (CK0,CK1)	b1 b0		0	R	W	
		0 0	The clock for display is supplied by connecting RC or LC across the pins OSC1 and OSC2.				
		0 1	Since the main clock is used as the clock for display, the oscillation frequency is limited. Because of this, the character size in width (horizontal) direction is also limited. In this case, pins OSC1 and OSC2 are also used as input ports P3 <sub>3</sub> and P3 <sub>4</sub> respectively.				CRT oscillation frequency = f(X <sub>IN</sub> )
		1 0	The same as the 0 1 case.				CRT oscillation frequency = f(X <sub>IN</sub> )/1.5
1 1	The clock for display is supplied by connecting the following across the pins OSC1 and OSC2. <ul style="list-style-type: none"> <li>• a ceramic resonator only for CRT display and a feedback resistor</li> <li>• a quartz-crystal oscillator only for CRT display and a feedback resistor (Note)</li> </ul>						
2 to 7	Fix these bits to "0."		0	R	W		

**Note:** It is necessary to connect other ceramic resonator or quartz-crystal oscillator across the pins X<sub>IN</sub> and X<sub>OUT</sub>.

CRT Clock Selection Register

**Address 00ED<sub>16</sub>**

**A-D Control Register 1**

A-D control register 1 (AD1) [Address 00EE<sub>16</sub>]

B	Name	Functions	After reset	R	W
0 to 2	Analog input pin selection bits (ADM0 to ADM2)	b2 b1 b0 0 0 0 : A-D1 0 0 1 : A-D2 0 1 0 : A-D3 0 1 1 : A-D4 1 0 0 : A-D5 1 0 1 : A-D6 1 1 0 : } Do not set. 1 1 1 : }	0	R	W
3, 5 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	
4	Storage bit of comparison result (ADM4)	0: Input voltage < reference voltage 1: Input voltage > reference voltage	Indeterminate	R	

A-D Control Register 1

**Address 00EE<sub>16</sub>**

**M37224M3-XXXSP**

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

A-D Control Register 2

A-D control register 2(AD2) [Address 00EF<sub>16</sub>]

B	Name	Functions	After reset	R	W
0 to 5	D-A converter set bits (ADC0 to ADC5)	b5 b4 b3 b2 b1 b0 0 0 0 0 0 0 : 1/128Vcc 0 0 0 0 0 1 : 3/128Vcc 0 0 0 0 1 0 : 5/128Vcc ⋮ 1 1 1 1 0 1 : 123/128Vcc 1 1 1 1 1 0 : 125/128Vcc 1 1 1 1 1 1 : 127/128Vcc	0	R	W
6, 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

A-D Control Register 2

**Address 00EF<sub>16</sub>**

Timer 12 Mode Register

Timer 12 mode register (T12M) [Address 00F4<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	Timer 1 count source selection bit (T12M0)	0: f(X <sub>IN</sub> )/16 1: f(X <sub>IN</sub> )/4096	0	R	W
1	Timer 2 count source selection bit (T12M1)	0: Internal clock 1: External clock from TIM2 pin	0	R	W
2	Timer 1 count stop bit (T12M2)	0: Count start 1: Count stop	0	R	W
3	Timer 2 count stop bit (T12M3)	0: Count start 1: Count stop	0	R	W
4	Timer 2 internal count source selection bit (T12M4)	0: f(X <sub>IN</sub> )/16 1: Timer 1 overflow	0	R	W
5	Fix this bit to "0."		0	R	W
6,7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

Timer 12 Mode Register

**Address 00F4<sub>16</sub>**

Timer 34 Mode Register

Timer 34 mode register (T34M) [Address 00F5<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	Timer 3 count source selection bit (T34M0)	0: f(X <sub>IN</sub> )/16 1: External clock	0	R	W
1	Timer 4 internal count source selection bit (T34M1)	0: Timer 3 overflow 1: f(X <sub>IN</sub> )/16	0	R	W
2	Timer 3 count stop bit (T34M2)	0: Count start 1: Count stop	0	R	W
3	Timer 4 count stop bit (T34M3)	0: Count start 1: Count stop	0	R	W
4	Timer 4 count source selection bit (T34M4)	0: Internal clock 1: f(X <sub>IN</sub> )/2	0	R	W
5	Timer 3 external count source selection bit (T34M5)	0: External clock from TIM3 pin 1: External clock from H <sub>SYNC</sub> pin	0	R	W
6,7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

Timer 34 Mode Register

Address 00F5<sub>16</sub>

Interrupt Input Polarity Register

Interrupt input polarity register(RE) [Address 00F9<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is indeterminate.		Indeterminate	R	—
1, 2	Fix these bits to "0."		0	R	W
3	INT1 polarity switch bit (RE3)	0: Positive polarity 1: Negative polarity	0	R	W
4	INT2 polarity switch bit (RE4)	0: Positive polarity 1: Negative polarity	0	R	W
5	INT3 polarity switch bit (RE5)	0: Positive polarity 1: Negative polarity	0	R	W
6	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R	—
7	Fix this bit to "0."		0	R	W

Interrupt Input Polarity Register

Address 00F9<sub>16</sub>

# M37224M3-XXXSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### CPU Mode Register

CPU mode register (CPU M (CM)) [Address FB16]

B	Name	Functions	After reset	R:W
0, 1	Processor mode bits (CM0, CM1)	b1 b0 0 0: Single-chip mode 0 1: } 1 0: } Not available 1 1: }	0	R:W
2	Stack page selection bit (CM2) (See note)	0: 0 page 1: 1 page	1	R:W
3 to 7	Fix these bits to "1."		1	R:W

**Note:** This bit is set to "1" after the reset release.

CPU Mode Register

**Address 00FB<sub>16</sub>**

### Interrupt Request Register 1

Interrupt request register 1 (IREQ1) [Address 00FC16]

B	Name	Functions	After reset	R:W
0	Timer 1 interrupt request bit (TM1R)	0: No interrupt request issued 1: Interrupt request issued	0	R:*
1	Timer 2 interrupt request bit (TM2R)	0: No interrupt request issued 1: Interrupt request issued	0	R:*
2	Timer 3 interrupt request bit (TM3R)	0: No interrupt request issued 1: Interrupt request issued	0	R:*
3	Timer 4 interrupt request bit (TM4R)	0: No interrupt request issued 1: Interrupt request issued	0	R:*
4	CRT interrupt request bit (CRTR)	0: No interrupt request issued 1: Interrupt request issued	0	R:*
5	Vsync interrupt request bit (VSCR)	0: No interrupt request issued 1: Interrupt request issued	0	R:*
6	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R:—
7	INT3 interrupt request bit (IT3R)	0: No interrupt request issued 1: Interrupt request issued	0	R:*

Interrupt Request Register 1

**Address 00FC<sub>16</sub>**

Interrupt Request Register 2

Interrupt request register 2 (IREQ2) [Address 00FD<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	INT1 interrupt request bit (IT1R)	0 : No interrupt request issued 1 : Interrupt request issued	0	R	*
1	INT2 interrupt request bit (IT2R)	0 : No interrupt request issued 1 : Interrupt request issued	0	R	*
2	Serial I/O interrupt request bit (SIR)	0 : No interrupt request issued 1 : Interrupt request issued	0	R	*
3, 5, 6	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—
4	f(XIN)/4096 interrupt request bit (MSR)	0 : No interrupt request issued 1 : Interrupt request issued	0	R	*
7	Fix this bit to "0."		0	R	W

\*: "0" can be set by software, but "1" cannot be set.

Interrupt Request Register 2

**Address 00FD<sub>16</sub>**

Interrupt Control Register 1

Interrupt control register 1 (ICON1) [Address 00FE<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	Timer 1 interrupt enable bit (TM1E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
1	Timer 2 interrupt enable bit (TM2E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
2	Timer 3 interrupt enable bit (TM3E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
3	Timer 4 interrupt enable bit (TM4E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
4	CRT interrupt enable bit (CRTE)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
5	VSYNC interrupt enable bit (VSCE)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
6	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R	—
7	INT3 interrupt enable bit (IN3E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W

Interrupt Control Register 1

**Address 00FE<sub>16</sub>**

Interrupt Control Register 2

Interrupt control register 2 (ICON2) [Address 00FF<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	INT1 interrupt enable bit (IT1E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
1	INT2 interrupt enable bit (IT2E)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
2	Serial I/O interrupt enable bit (SIE)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W
3, 5 to 7	Fix these bits to "0."		0	R	W
4	f(X <sub>IN</sub> )/4096 interrupt enable bit (MSE)	0 : Interrupt disabled 1 : Interrupt enabled	0	R	W

Interrupt Control Register 2

**Address 00FF<sub>16</sub>**

ROM Correction Enable Register

ROM correction enable register (RCR) [Address 021B<sub>16</sub>]

B	Name	Functions	After reset	R	W
0	Block 1 enable bit (RC0)	0: Disabled 1: Enabled	0	R	W
1	Block 2 enable bit (RC1)	0: Disabled 1: Enabled	0	R	W
2,3	Fix these bits to "0."		0	R	W
4 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

ROM Correction Enable Register

**Address 021B<sub>16</sub>**

Keep safety first in your circuit designs!

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
  - Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.

## REVISION DESCRIPTION LIST

M37221EF-XXXSP, M37221EFSP DATA SHEET

Rev. No.	Revision Description	Rev. date
1.0	First Edition	9708
2.0	Information about copyright note, revision number, release data added (last page).	971130
2.1	Correct note (P43)	980731
