

# AC/DC to Logic Interface Optocouplers

## Technical Data

**HCPL-0370**  
**HCPL-3700**  
**HCPL-3760**

### Features

- **Standard (HCPL-0370/3700) and Low Input Current (HCPL-3760) Versions**
- **AC or DC Input**
- **Programmable Sense Voltage**
- **Hysteresis**
- **Logic Compatible Output**
- **Thresholds Guaranteed over Temperature**
- **Thresholds Independent of LED Optical Parameters**
- **Recognized under UL 1577 and CSA Approved for Dielectric Withstand Proof Test Voltage of 3750 Vac, 1 Minute**

### Applications

- **Limit Switch Sensing**
- **Low Voltage Detector**
- **5 V-240 V AC/DC Voltage Sensing**
- **Relay Contact Monitor**
- **Relay Coil Voltage Monitor**
- **Current Sensing**
- **Microprocessor Interfacing**

### Description

The HCPL-0370/3700 and HCPL-3760 are voltage/current threshold detection optocouplers. The HCPL-3760 is a low-current version of the HCPL-0370/3700. To obtain lower current operation, the HCPL-3760 uses a high-efficiency AlGaAs LED which provides higher light output at lower drive currents. The devices utilize threshold sensing input buffer ICs which permit control of threshold levels over a wide range of input voltages with a single external resistor.

### Functional Diagram

**TRUTH TABLE  
(POSITIVE LOGIC)**

INPUT	OUTPUT
H	L
L	H

The input buffer incorporates several features: hysteresis for extra noise immunity and switching immunity, a diode bridge for easy use with ac input signals, and internal clamping

*CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.*

diodes to protect the buffer and LED from a wide range of over-voltage and over-current transients. Because threshold sensing is done prior to driving the LED, variations in optical coupling from the LED to the detector will have no effect on the threshold levels.

The HCPL-0370/3700's input buffer IC has a nominal turn on threshold of 2.5 mA ( $I_{TH+}$ ) and 3.7 volts ( $V_{TH+}$ ).

The buffer IC for the HCPL-3760 was redesigned to permit a lower input current. The nominal turn on threshold for the HCPL-3760 is 1.2 mA ( $I_{TH+}$ ) and 3.7 volts ( $V_{TH+}$ ).

The high gain output stage features an open collector output providing both TTL compatible

saturation voltages and CMOS compatible breakdown voltages.

By combining several unique functions in a single package, the user is provided with an ideal component for industrial control computer input boards and other applications where a predetermined input threshold level is desirable.

## Ordering Information

Specify Part Number followed by Option Number (if desired)

Example

HCPL-0370#XXXX

- No option = SO8 Package.
- 500 = Tape/Reel Package Option (1 K min.).
- XXXE = Lead Free Option.

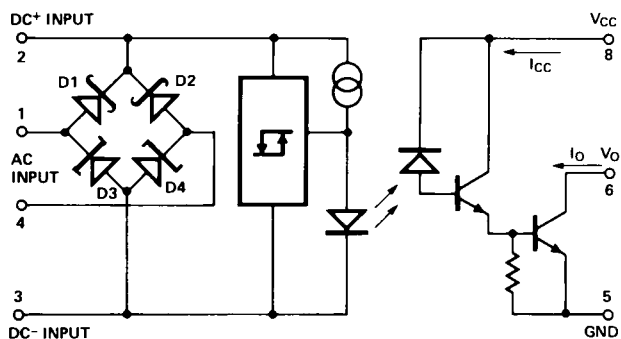

HCPL-37x0#XXXX

- 020 = 5000 V rms/1 minute UL Rating Option.
- 300 = Gull Wing Surface Mount Option.
- 500 = Tape/Reel Package Option (1 K min.).
- XXXE = Lead Free Option.

Option data sheets available. Contact your Agilent sales representative or authorized distributor for information.

Remarks: The notation “#” is used for existing products, while (new) products launched since 15th July 2001 and lead free option will use “-”

## Schematic

## Package Outline Drawings Standard DIP Package (HCPL-3700/3760)

DIMENSIONS IN MILLIMETERS AND (INCHES).

NOTE: FLOATING LEAD PROTRUSION IS 0.25 mm (10 mils) MAX.

## Gull Wing Surface Mount Option 300 (HCPL-3700/3760)

DIMENSIONS IN MILLIMETERS (INCHES).  
TOLERANCES (UNLESS OTHERWISE SPECIFIED): xx.xx = 0.01  
xx.xxx = 0.005

LEAD COPLANARITY  
MAXIMUM: 0.102 (0.004)

NOTE: FLOATING LEAD PROTRUSION IS 0.25 mm (10 mils) MAX.

## Package Outline Drawings, continued

### Small Outline SO-8 Package (HCPL-0370)

\* TOTAL PACKAGE LENGTH (INCLUSIVE OF MOLD FLASH)  
5.207 ± 0.254 (0.205 ± 0.010)

DIMENSIONS IN MILLIMETERS (INCHES).  
LEAD COPLANARITY = 0.10 mm (0.004 INCHES) MAX.

NOTE: FLOATING LEAD PROTRUSION IS 0.15 mm (6 mils) MAX.

## Solder Reflow Thermal Profile

## Recommended Pb-Free IR Profile

NOTES:  
 THE TIME FROM 25 °C TO PEAK TEMPERATURE = 8 MINUTES MAX.  
 $T_{smax} = 200^{\circ}\text{C}$ ,  $T_{ssmin} = 150^{\circ}\text{C}$

## Regulatory Information

The HCPL-0370/3700/3760 has been approved by the following organizations:

### UL

Recognized under UL 1577, component recognition program, File E55361 (HCPL-0370 pending).

### CSA

Approved under CSA Component Acceptance Notice #5, File CA 88324.

## Insulation and Safety Related Specifications

Parameter	Symbol	8-Pin DIP (300 mil) Value	SO-8 Value	Units	Conditions

\*The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the IEC/EN/DIN EN 60747-5-2 Insulation Characteristics Table (if applicable), your equipment level safety specification, or Agilent Application Note 1074, "Optocoupler Input-Output Endurance Voltage."

**Notes:**

1. Measured at a point 1.6 mm below seating plane.
2. Current into/out of any single lead.
3. Surge input current duration is 3 ms at 120 Hz pulse repetition rate. Transient input current duration is 10  $\mu$ s at 120 Hz pulse repetition rate. Note that maximum input power,  $P_{IN}$ , must be observed.
4. Derate linearly above 70°C free-air temperature at a rate of 4.1 mW/°C (HCPL-3700/3760) and 3.1 mW/°C (HCPL-0370). Maximum input power dissipation of 230 mW (HCPL-3700/3760) and 172 mW (HCPL-0370) allows an input IC junction temperature of 125°C at an ambient temperature of  $T_A = 70^\circ\text{C}$ . Excessive  $P_{IN}$  and  $T_J$  may result in IC chip degradation.
5. Derate linearly above 70°C free-air temperature at a rate of 5.4 mW/°C (HCPL-3700/3760) and 5 mW/°C (HCPL-0370).
6. Derate linearly above 70°C free-air temperature at a rate of 3.9 mW/°C (HCPL-3700/3760) and 1.9 mW/°C (HCPL-0370). Maximum output power dissipation of 210 mW (HCPL-3700/3760) and 103 mW (HCPL-0370) allows an output IC junction temperature of 125°C at an ambient temperature of  $T_A = 70^\circ\text{C}$ .
7. Derate linearly above 70°C free-air temperature at a rate of 0.6 mA/°C.
8. Maximum operating frequency is defined when output waveform Pin 6 obtains only 90% of  $V_{CC}$  with  $R_L = 4.7\text{ k}\Omega$ ,  $C_L = 30\text{ pF}$  using a 5 V square wave input signal.
9. All typical values are at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5.0\text{ V}$  unless otherwise stated.
10. The  $t_{PHL}$  propagation delay is measured from the 2.5 V level of the leading edge of a 5.0 V input pulse (1  $\mu$ s rise time) to the 1.5 V level on the leading edge of the output pulse (see Figure 10).
11. The  $t_{PLH}$  propagation delay is measured from the 2.5 V level of the trailing edge of a 5.0 V input pulse (1  $\mu$ s fall time) to the 1.5 V level on the trailing edge of the output pulse (see Figure 10).
12. Common mode transient immunity in Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , to insure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to insure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{ V}$ ). See Figure 11.
13. In applications where  $dV_{CM}/dt$  may exceed 50,000 V/ $\mu$ s (such as static discharge), a series resistor,  $R_{CC}$ , should be included to protect the detector IC from destructively high surge currents. The recommended value for  $R_{CC}$  is 240  $\Omega$  per volt of allowable drop in  $V_{CC}$  (between Pin 8 and  $V_{CC}$ ) with a minimum value of 240  $\Omega$ .
14. Logic low output level at Pin 6 occurs under the conditions of  $V_{IN} \geq V_{TH+}$  as well as the range of  $V_{IN} > V_{TH-}$  once  $V_{IN}$  has exceeded  $V_{TH+}$ . Logic high output level at Pin 6 occurs under the conditions of  $V_{IN} \leq V_{TH}$  as well as the range of  $V_{IN} < V_{TH+}$  once  $V_{IN}$  has decreased below  $V_{TH}$ .
15. AC voltage is instantaneous voltage.
16. Device considered a two terminal device: Pins 1, 2, 3, 4 connected together, and Pins 5, 6, 7, 8 connected together.
17. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 4500\text{ V rms}$  for 1 second (leakage detection current limit,  $I_{i-o} \leq 5\text{ }\mu\text{A}$ ).
18. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 6000\text{ V rms}$  for 1 second (leakage detection current limit,  $I_{i-o} \leq 5\text{ }\mu\text{A}$ ). This test is performed before the 100% production test for partial discharge (Method b) shown in the IEC/EN/DIN EN 60747-5-2 Insulation Characteristics Table.

**Figure 13. External Threshold Voltage Level Selection.**

## Electrical Considerations

The HCPL-0370/3700/3760 optocouplers have internal temperature compensated, predictable voltage and current threshold points which allow selection of an external resistor,  $R_X$ , to determine larger external threshold voltage levels. For a desired external threshold voltage,  $V_{\pm}$ , a corresponding typical value of  $R_X$  can be obtained from Figure 12. Specific calculation of  $R_X$  can be obtained from Equation (1). Specification of both  $V_+$  and  $V_-$  voltage threshold levels simultaneously can be obtained by the use of  $R_X$  and  $R_P$  as shown in Figure 13 and determined by Equations (2) and (3).

$R_X$  can provide over-current transient protection by limiting input current during a transient condition. For monitoring contacts of a relay or switch, the HCPL-0370/3700/3760 in combination with  $R_X$  and  $R_P$  can be used to allow a specific current to be conducted through the contacts for cleaning purposes (wetting current).

The choice of which input voltage clamp level to choose depends upon the application of this device (see Figure 1). It is recommended that the low clamp condition be used when possible.

The low clamp condition in conjunction with the low input current feature will ensure extremely low input power dissipation.

In applications where  $dV_{CM}/dt$  may be extremely large (such as static discharge), a series resistor,  $R_{CC}$ , should be connected in series with  $V_{CC}$  and Pin 8 to protect the detector IC from destructively high surge currents. See Note 13 for determination of  $R_{CC}$ . In addition, it is recommended that a ceramic disc bypass capacitor of  $0.01 \mu F$  be placed between Pins 8 and 5 to reduce the effect of power supply noise.

For interfacing ac signals to TTL systems, output low pass filtering can be performed with a pullup resistor of  $1.5 k\Omega$  and  $20 \mu F$  capacitor. This application requires a Schmitt trigger gate to avoid slow rise time chatter problems. For ac input applications, a filter capacitor can be placed across the dc input terminals for either signal or transient filtering.

Either ac (Pins 1, 4) or dc (Pins 2, 3) input can be used to determine external threshold levels.

For one specifically selected external threshold voltage level  $V_+$  or  $V_-$ ,  $R_X$  can be determined without use of  $R_P$  via

$$R_X = \frac{V_+ - V_{TH+}(-)}{I_{TH+}(-)} \quad (1)$$

For two specifically selected external threshold voltage levels,  $V_+$  and  $V_-$ , the use of  $R_X$  and  $R_P$  will permit this selection via equations (2), (3) provided the following conditions are met. If the denominator of equation (2) is positive, then

$$\frac{V_+}{V_-} \geq \frac{V_{TH+}}{V_{TH-}} \quad \text{and} \quad \frac{V_+ - V_{TH+}}{V_- - V_{TH-}} < \frac{I_{TH+}}{I_{TH-}}$$

Conversely, if the denominator of equation (2) is negative, then

$$\frac{V_+}{V_-} \leq \frac{V_{TH+}}{V_{TH-}} \quad \text{and} \quad \frac{V_+ - V_{TH+}}{V_- - V_{TH-}} > \frac{I_{TH+}}{I_{TH-}}$$

$$R_X = \frac{V_{TH-}(V_+) - V_{TH+}(V_-)}{I_{TH+}(V_{TH-}) - I_{TH-}(V_{TH+})} \quad (2)$$

$$R_P = \frac{V_{TH-}(V_+) - V_{TH+}(V_-)}{I_{TH+}(V_- - V_{TH-}) + I_{TH-}(V_{TH+} - V_+)} \quad (3)$$
