- Handle this document carefully for it contains material protected by international copyright law. Any reproduction, full or in part, of this material is prohibited without the express written permission of the company.

- When using the products covered herein, please observe the conditions written herein and the precautions outlined in the following paragraphs. In no event shall the company be liable for any damages resulting from failure to strictly adhere to these conditions and precautions.

(1) The products covered herein are designed and manufactured for the following application areas. When using the products covered herein for the equipment listed in Paragraph (2), even for the following application areas, be sure to observe the precautions given in Paragraph (2). Never use the products for the equipment listed in Paragraph (3).

- Office electronics
- Instrumentation and measuring equipment
- Machine tools
- Audiovisual equipment
- Home appliance
- Communication equipment other than for trunk lines

(2) Those contemplating using the products covered herein for the following equipment which demands high reliability, should first contact a sales representative of the company and then accept responsibility for incorporating into the design fail-safe operation, redundancy, and other appropriate measures for ensuring reliability and safety of the equipment and the overall system.

- Control and safety devices for airplanes, trains, automobiles, and other transportation equipment
- Mainframe computers
- Traffic control systems
- Gas leak detectors and automatic cutoff devices
- Rescue and security equipment
- Other safety devices and safety equipment, etc.

(3) Do not use the products covered herein for the following equipment which demands extremely high performance in terms of functionality, reliability, or accuracy.

- Aerospace equipment
- Communications equipment for trunk lines
- Control equipment for the nuclear power industry
- Medical equipment related to life support, etc.

(4) Please direct all queries and comments regarding the interpretation of the above three Paragraphs to a sales representative of the company.

- Please direct all queries regarding the products covered herein to a sales representative of the company.

128Mbit (8Mbit×16)

Page Mode Dual Work Flash MEMORY

- 128-M density with 16-bit I/O Interface
- High Performance Reads
 - 75/25ns 8-Word Page Mode
- 6-Plane Dual Work Operation
 - Read operations are available during Block Erase or (Page Buffer) Program between two different Planes
 - Plane Architecture: 16M, 24M, 24M, 24M, 24M, 16M
- Low Power Operation
 - 2.7V Read and Write Operations
 - V_{CCQ} for Input/Output Power Supply Isolation
 - Automatic Power Savings Mode reduces I_{CCR} in Static Mode
- Enhanced Code + Data Storage
 - 5μs Typical Erase/Program Suspends
- OTP (One Time Program) Block
 - 4-Word Factory-Programmed Area
 - 4-Word User-Programmable Area
- High Performance Program with Page Buffer
 - 16-Word Page Buffer
 - 5μs/Word (Typ.) at WP#/ACC=9.5V
- Operating Temperature -40°C to +85°C
- CMOS Process (P-type silicon substrate)
- Flexible Blocking Architecture
 - Eight 4-Kword Parameter Blocks
 - Two-hundred and fifty-five 32-Kword Main Blocks
 - Bottom Parameter Location
- Enhanced Data Protection Features
 - Individual Block Lock and Block Lock-Down with Zero-Latency
 - All blocks are locked at power-up or device reset.
 - Block Erase, Full Chip Erase, (Page Buffer) Word Program Lockout during Power Transitions
- Automated Erase/Program Algorithms
 - 3.0V Low-Power 11μs/Word (Typ.) Programming
 - 9.5V No Glue Logic 9μs/Word (Typ.) Production Programming and 0.8s Erase (Typ.)
- Cross-Compatible Command Support
 - Basic Command Set
 - Common Flash Interface (CFI)
- Extended Cycling Capability
 - Minimum 100,000 Block Erase Cycles
- 56-Lead TSOP (Normal Bend)
- ETOXTM* Flash Technology
- Not designed or rated as radiation hardened

The product, which is 6-Plane Page Mode Dual Work (Simultaneous Read while Erase/Program) Flash memory, is a low power, high density, low cost, nonvolatile read/write storage solution for a wide range of applications. The product can operate at V_{CC}=2.7V-3.3V. Its low voltage operation capability greatly extends battery life for portable applications.

The product provides high performance asynchronous page mode. It allows code execution directly from Flash, thus eliminating time consuming wait states.

The memory array block architecture utilizes Enhanced Data Protection features, and provides separate Parameter and Main Blocks that provide maximum flexibility for safe nonvolatile code and data storage.

Fast program capability is provided through the use of high speed Page Buffer Program.

Special OTP (One Time Program) block provides an area to store permanent code such as an unique number.

Figure 1. 56-Lead TSOP (Normal Bend) Pinout

Table 1. Pin Descriptions

Symbol	Type	Name and Function
$A_{22}-A_0$	INPUT	ADDRESS INPUTS: Inputs for addresses.
$DQ_{15}-DQ_0$	INPUT/ OUTPUT	DATA INPUTS/OUTPUTS: Inputs data and commands during CUI (Command User Interface) write cycles, outputs data during memory array, status register, query code and identifier code reads. Data pins float to high-impedance (High Z) when the chip or outputs are deselected. Data is internally latched during an erase or program cycle.
CE#	INPUT	CHIP ENABLE: Activates the device's control logic, input buffers, decoders and sense amplifiers. CE#-high (V_{IH}) deselects the device and reduces power consumption to standby levels.
RST#	INPUT	RESET: When low (V_{IL}), RST# resets internal automation and inhibits write operations which provides data protection. RST#-high (V_{IH}) enables normal operation. After power-up or reset mode, the device is automatically set to read array mode. RST# must be low during power-up/down.
OE#	INPUT	OUTPUT ENABLE: Gates the device's outputs during a read cycle.
WE#	INPUT	WRITE ENABLE: Controls writes to the CUI and array blocks. Addresses and data are latched on the rising edge of CE# or WE# (whichever goes high first).
WP#/ACC	INPUT/ SUPPLY	WRITE PROTECT: When WP#/ACC is V_{IL} , locked-down blocks cannot be unlocked. Erase or program operation can be executed to the blocks which are not locked and not locked-down. When WP#/ACC is V_{IH} , lock-down is disabled. Applying $9.5V \pm 0.5V$ to WP#/ACC provides fast erasing or fast programming mode. In this mode, WP#/ACC is power supply pin. Applying $9.5V \pm 0.5V$ to WP#/ACC during erase/program can only be done for a maximum of 1,000 cycles on each block. WP#/ACC may be connected to $9.5V \pm 0.5V$ for a total of 80 hours maximum. Use of this pin at $9.5V + 0.5V$ beyond these limits may reduce block cycling capability or cause permanent damage.
RY/BY#	OPEN DRAIN OUTPUT	READY/BUSY#: Indicates the status of the internal WSM (Write State Machine). When low, WSM is performing an internal operation (block erase, full chip erase, (page buffer) program or OTP program). RY/BY#-High Z indicates that the WSM is ready for new commands, block erase is suspended and (page buffer) program is inactive, (page buffer) program is suspended, or the device is in reset mode.
V_{CC}	SUPPLY	DEVICE POWER SUPPLY (2.7V-3.3V): With $V_{CC} \leq V_{LKO}$, all write attempts to the flash memory are inhibited. Device operations at invalid V_{CC} voltage (see DC Characteristics) produce spurious results and should not be attempted.
V_{CCQ}	SUPPLY	INPUT/OUTPUT POWER SUPPLY (2.7V-3.3V): Power supply for all input/output pins.
GND	SUPPLY	GROUND: Do not float any ground pins.
NC		NO CONNECT: Lead is not internally connected; it may be driven or floated.

Table 2. Simultaneous Operation Modes Allowed with 6 Planes ^(1, 2)

IF ONE PLANE IS:	THEN THE MODES ALLOWED IN THE OTHER PLANE IS:										
	Read Array	Read ID/OTP	Read Status	Read Query	Word Program	Page Buffer Program	OTP Program	Block Erase	Full Chip Erase	Program Suspend	Block Erase Suspend

Block Erase	X	X	X	X							
Full Chip Erase			X								
Program Suspend	X	X	X	X							X
Block Erase Suspend	X	X	X	X	X	X				X	

NOTES:

1. "X" denotes the operation available.
2. Dual Work Restrictions:
 - Status register reflects WSM (Write State Machine) state.
 - Only one plane can be erased or programmed at a time - no command queuing.
 - Commands must be written to an address within the block targeted by that command.

NOTES:

1. A₂₂-A₁₆ must be the address within the plane to which the Read Identifier Codes/OTP command (90H) has been written.
2. Block Address = The beginning location of a block address within the plane to which the Read Identifier Codes/OTP command (90H) has been written.
3. DQ₁₅-DQ₂ are reserved for future implementation.
4. OTP-LK=OTP Block Lock configuration.
5. OTP=OTP Block data.

Write	4,5,6	V _{IH}	V _{IL}	V _{IH}	V _{IL}	X	D _{IN}	X

NOTES:

1. Refer to DC Characteristics for V_{IL} or V_{IH} voltages.
2. X can be V_{IL} or V_{IH} for control pins and addresses.
3. RST# at GND±0.2V ensures the lowest power consumption.
4. Command writes involving block erase, full chip erase, (page buffer) program or OTP program are reliably executed when V_{CC}=2.7V-3.3V.
5. Refer to Table 5 for valid D_{IN} during a write operation.
6. Never hold OE# low and WE# low at the same timing.
7. Query code = Common Flash Interface (CFI) code.
8. RY/BY# is V_{OL} when the WSM (Write State Machine) is executing internal block erase, full chip erase, (page buffer) program or OTP program algorithms. It is High Z during when the WSM is not busy, in block erase suspend mode (with program and page buffer program inactive), (page buffer) program suspend mode, or reset mode.

Set Block Lock-down Bit	2		Write	BA	60H	Write	BA	2FH
OTP Program	2	9	Write	OA	C0H	Write	OA	OD

NOTES:

- Bus operations are defined in Table 4.
- All addresses which are written at the first bus cycle should be the same as the addresses which are written at the second bus cycle.
X=Any valid address within the device.
PA=Address within the selected plane.
IA=Identifier codes address (See Table 3).
QA=Query codes address.
BA=Address within the block being erased, set/cleared block lock bit or set block lock-down bit.
WA=Address of memory location for the Program command or the first address for the Page Buffer Program command.
OA=Address of OTP block to be read or programmed (See Figure 3).
- ID=Data read from identifier codes. (See Table 3).
QD=Data read from query database.
SRD=Data read from status register. See Table 9.1, Table 9.2 for a description of the status register bits.
WD=Data to be programmed at location WA. Data is latched on the rising edge of WE# or CE# (whichever goes high first) during command write cycles.
OD=Data within OTP block. Data is latched on the rising edge of WE# or CE# (whichever goes high first) during command write cycles.
N-1=N is the number of the words to be loaded into a page buffer.
- Following the Read Identifier Codes/OTP command, read operations access manufacturer code, device code, block lock configuration code and the data within OTP block (See Table 3).
The Read Query command is available for reading CFI (Common Flash Interface) information.
- Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when RST# is V_{IH}.
- Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.

7. Following the third bus cycle, input the program sequential address and write data of "N" times. Finally, input the any valid address within the target block to be programmed and the confirm command (DOH).
8. If the program operation in one plane is suspended and the erase operation in other plane is also suspended, the suspended program operation will be resumed first.
9. Full chip erase and OTP program operations can not be suspended. The OTP Program command can not be accepted while the block erase operation is being suspended.
10. Following the Clear Block Lock Bit command, block which is not locked-down is unlocked when WP#/ACC is V_{IL} . When WP#/ACC is V_{IH} , lock-down bit is disabled and the selected block is unlocked regardless of lock-down configuration.
11. Commands other than those shown above are reserved by SHARP for future device implementations and should not be used.

Table 6. Functions of Block Lock⁽⁵⁾ and Block Lock-Down

Current State					Erase/Program Allowed ⁽²⁾
State	WP#/ACC	DQ ₁ ⁽¹⁾	DQ ₀ ⁽¹⁾	State Name	
[000]	0	0	0	Unlocked	Yes
[001] ⁽³⁾	0	0	1	Locked	No
[011]	0	1	1	Locked-down	No
[100]	1	0	0	Unlocked	Yes
[101] ⁽³⁾	1	0	1	Locked	No
[110] ⁽⁴⁾	1	1	0	Lock-down Disable	Yes
[111]	1	1	1	Lock-down Disable	No

NOTES:

- DQ₀=1: a block is locked; DQ₀=0: a block is unlocked.
DQ₁=1: a block is locked-down; DQ₁=0: a block is not locked-down.
- Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.
- At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [001] (WP#/ACC=0) or [101] (WP#/ACC=1), regardless of the states before power-off or reset operation.
- When WP#/ACC is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.
- OTP (One Time Program) block has the lock function which is different from those described above.

Table 7. Block Locking State Transitions upon Command Write⁽⁴⁾

Current State				Result after Lock Command Written (Next State)		
State	WP#/ACC	DQ ₁	DQ ₀	Set Lock ⁽¹⁾	Clear Lock ⁽¹⁾	Set Lock-down ⁽¹⁾
[000]	0	0	0	[001]	No Change	[011] ⁽²⁾
[001]	0	0	1	No Change ⁽³⁾	[000]	[011]
[011]	0	1	1	No Change	No Change	No Change
[100]	1	0	0	[101]	No Change	[111] ⁽²⁾
[101]	1	0	1	No Change	[100]	[111]
[110]	1	1	0	[111]	No Change	[111] ⁽²⁾
[111]	1	1	1	No Change	[110]	No Change

NOTES:

- "Set Lock" means Set Block Lock Bit command, "Clear Lock" means Clear Block Lock Bit command and "Set Lock-down" means Set Block Lock-Down Bit command.
- When the Set Block Lock-Down Bit command is written to the unlocked block (DQ₀=0), the corresponding block is locked-down and automatically locked at the same time.
- "No Change" means that the state remains unchanged after the command written.
- In this state transitions table, assumes that WP#/ACC is not changed and fixed V_{IL} or V_{IH}.

Table 8. Block Locking State Transitions upon WP#/ACC Transition⁽⁴⁾

Previous State	Current State				Result after WP#/ACC Transition (Next State)	
	State	WP#/ACC	DQ ₁	DQ ₀	WP#/ACC=0→1 ⁽¹⁾	WP#/ACC=1→0 ⁽¹⁾
-	[000]	0	0	0	[100]	-
-	[001]	0	0	1	[101]	-
[110] ⁽²⁾	[011]	0	1	1	[110]	-
Other than [110] ⁽²⁾					[111]	-
-	[100]	1	0	0	-	[000]
-	[101]	1	0	1	-	[001]
-	[110]	1	1	0	-	[011] ⁽³⁾
-	[111]	1	1	1	-	[011]

NOTES:

1. "WP#/ACC=0→1" means that WP#/ACC is driven to V_{IH} and "WP#/ACC=1→0" means that WP#/ACC is driven to V_{IL}.
2. State transition from the current state [011] to the next state depends on the previous state.
3. When WP#/ACC is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.
4. In this state transitions table, assumes that lock configuration commands are not written in previous, current and next state.

***WARNING:** Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.

NOTES:

1. Operating temperature is for extended temperature product defined by this specification.
2. All specified voltages are with respect to GND. Minimum DC voltage is -0.5V on input/output pins and -0.2V on V_{CC}, V_{CCQ} and WP#/ACC pins. During transitions, this level may undershoot to -2.0V for periods <20ns. Maximum DC voltage on input/output pins is V_{CC}+0.5V which, during transitions, may overshoot to V_{CC}+2.0V for periods <20ns.
3. Maximum DC voltage on WP#/ACC may overshoot to +11.0V for periods <20ns.
4. WP#/ACC erase/program voltage is normally 2.7V-3.3V. Applying 9.0V-10.0V to WP#/ACC during erase/program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks. WP#/ACC may be connected to 9.0V-10.0V for a total of 80 hours maximum.
5. Output shorted for no more than one second. No more than one output shorted at a time.

1.2 Operating Conditions

Parameter Block Erase Cycling: WP#/ACC=V _{ACCH} , 80 hrs.				1,000	Cycles	
Maximum WP#/ACC hours at V _{ACCH}				80	Hours	

NOTES:

1. See DC Characteristics tables for voltage range-specific specification.
2. Applying WP#/ACC=9.0V-10.0V during a erase or program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks. A permanent connection to WP#/ACC=9.0V-10.0V is not allowed and can cause damage to the device.

V_{LKO}	V_{CC} Lockout Voltage		1.5			V	

NOTES:

- All currents are in RMS unless otherwise noted. Typical values are the reference values at $V_{CC}=3.0V$, $V_{CCQ}=3.0V$ and $T_A=+25^\circ C$ unless V_{CC} is specified.
- I_{CCWS} and I_{CCES} are specified with the device de-selected. If read or (page buffer) program is executed while in block erase suspend mode, the device's current draw is the sum of I_{CCES} and I_{CCR} or I_{CCW} . If read is executed while in (page buffer) program suspend mode, the device's current draw is the sum of I_{CCWS} and I_{CCR} .
- The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings (t_{AVQV}) provide new data when addresses are changed.
- Sampled, not 100% tested.
- Applying $9.5V \pm 0.5V$ to WP#/ACC provides fast erasing or fast programming mode. In this mode, WP#/ACC is power supply pin and supplies the memory cell current for block erasing and (page buffer) programming. Use similar power supply trace widths and layout considerations given to the V_{CC} power bus.
Applying $9.5V \pm 0.5V$ to WP#/ACC during erase/program can only be done for a maximum of 1,000 cycles on each block. WP#/ACC may be connected to $9.5V \pm 0.5V$ for a total of 80 hours maximum.
- The operating current in dual work is the sum of the operating current (read, erase, program) in each plane.
- For all pins other than those shown in test conditions, input level is V_{CCQ} or GND.
- Includes RY/BY#.

1.2.4 AC Characteristics - Read-Only Operations⁽¹⁾

NOTES:

1. See AC input/output reference waveform for timing measurements and maximum allowable input slew rate.
2. Sampled, not 100% tested.
3. OE# may be delayed up to $t_{ELQV} - t_{GLQV}$ after the falling edge of CE# without impact to t_{ELQV} .
4. Address setup time (t_{AVEL}, t_{AVGL}) is defined from the falling edge of CE# or OE# (whichever goes low last).
5. Address hold time (t_{ELAX}, t_{GLAX}) is defined from the falling edge of CE# or OE# (whichever goes low last).
6. Specifications $t_{AVEL}, t_{AVGL}, t_{ELAX}, t_{GLAX}$ and t_{EHEL}, t_{GHGL} for read operations apply to only status register read operations.

NOTES:

- The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program and OTP program operations are the same as during read-only operations. Refer to AC Characteristics for read-only operations.
- A write operation can be initiated and terminated with either CE# or WE#.
- Sampled, not 100% tested.
- Write pulse width (t_{WP}) is defined from the falling edge of CE# or WE# (whichever goes low last) to the rising edge of CE# or WE# (whichever goes high first). Hence, $t_{WP}=t_{WLWH}=t_{ELEH}=t_{WLEH}=t_{ELWH}$.
- Write pulse width high (t_{WPH}) is defined from the rising edge of CE# or WE# (whichever goes high first) to the falling edge of CE# or WE# (whichever goes low last). Hence, $t_{WPH}=t_{WHWL}=t_{EHEL}=t_{WHEL}=t_{EHWL}$.
- t_{WHR0} (t_{EHR0}) after the Read Query or Read Identifier Codes/OTP command= $t_{AVQV}+100ns$.
- Refer to Table 5 for valid address and data for block erase, full chip erase, (page buffer) program, OTP program or lock bit configuration.

NOTES:

1. V_{CC} power-up and standby.
2. Write each first cycle command.
3. Write each second cycle command or valid address and data.
4. Automated erase or program delay.
5. Read status register data.
6. For read operation, OE# and CE# must be driven active, and WE# de-asserted.

t_{PLPH}	RST# Low to Reset during Read (RST# should be low during power-up.)	1, 2, 3	100		ns
t_{PLRH}	RST# Low to Reset during Erase or Program	1, 3, 4		22	μs
t_{2VPH}	V_{CC} 2.7V to RST# High	1, 3, 5	100		ns
t_{VHQV}	V_{CC} 2.7V to Output Delay	3		1	ms

NOTES:

1. A reset time, t_{PHQV} , is required from the later of SR.7 (RY/BY#) going "1" (High Z) or RST# going high until outputs are valid. Refer to AC Characteristics - Read-Only Operations for t_{PHQV} .
2. t_{PLPH} is <100ns the device may still reset but this is not guaranteed.
3. Sampled, not 100% tested.
4. If RST# asserted while a block erase, full chip erase, (page buffer) program or OTP program operation is not executing, the reset will complete within 100ns.
5. When the device power-up, holding RST# low minimum 100ns is required after V_{CC} has been in predefined range and also has been in stable there.

t_{ERES}	Latency Time from Block Erase Resume Command to Block Erase Suspend Command	5	-	500			500			μs

NOTES:

1. Typical values measured at $V_{CC}=3.0V$, WP#/ACC=3.0V or 9.5V, and $T_A=+25^{\circ}C$. Assumes corresponding lock bits are not set. Subject to change based on device characterization.
2. Excludes external system-level overhead.
3. Sampled, but not 100% tested.
4. A latency time is required from writing suspend command (WE# or CE# going high) until SR.7 going "1" or RY/BY# going High Z.
5. If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t_{ERES} and its sequence is repeated, the block erase operation may not be finished.

A-1 RECOMMENDED OPERATING CONDITIONS

A-1.1 At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

Figure A-1. AC Timing at Device Power-Up

For the AC specifications t_{VR} , t_r , t_f in the figure, refer to the next page. See the "ELECTRICAL SPECIFICATIONS" described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.

A-1.1.1 Rise and Fall Time

Symbol	Parameter	Notes	Min.	Max.	Unit
t_{VR}	V_{CC} Rise Time	1	0.5	30000	$\mu\text{s/V}$
t_R	Input Signal Rise Time	1, 2		1	$\mu\text{s/V}$
t_F	Input Signal Fall Time	1, 2		1	$\mu\text{s/V}$

NOTES:

1. Sampled, not 100% tested.
2. This specification is applied for not only the device power-up but also the normal operations.

A-1.2 Glitch Noises

Do not input the glitch noises which are below V_{IH} (Min.) or above V_{IL} (Max.) on address, data, reset, and control signals, as shown in Figure A-2 (b). The acceptable glitch noises are illustrated in Figure A-2 (a).

Figure A-2. Waveform for Glitch Noises

See the “DC CHARACTERISTICS” described in specifications for V_{IH} (Min.) and V_{IL} (Max.).
