

System Lens Driver Series for Mobile Phone Cameras

Parallel Interface Type Lens Drivers for Voice Coil Motor

**BD6883GUL, BH6453GUL****BD6886GUL, BD6369GUL**

●Description

The BD6883GUL, and the BH6453GUL motor driver provide 1 Constant-Current Driver Half-bridge, and 1 Constant-Voltage Driver Half-bridge channel. The BD6886GUL, and the BD6369GUL motor driver provide 1 Constant-Voltage Driver H-bridge channel. These lens drivers are offered in an ultra-small functional lens system for use in an auto focus system using a Voice Coil motor.

●Features

1) BD6883GUL Characteristics

- 1) Ultra-small chip size package; 1.1mm × 1.6mm × 0.55mm
- 2) Low ON-Resistance Power CMOS output; on high side PMOS typ.0.65Ω, on low side NMOS typ.0.40Ω
- 3) ESD resistance (Human Body Model); 8kV
- 4) Built-in ±5% high-precision Constant-Voltage Driver (phase compensation capacitor-free design)
- 5) Built-in UVLO (Under Voltage Locked Out: UVLO)
- 6) Built-in TSD (Thermal Shut Down) circuit
- 7) Standby current consumption: 0μA Typ.

2) BH6453GUL Characteristics

- 1) Ultra-small chip size package; 1.5mm × 0.9mm × 0.55mm
- 2) Low ON-Resistance Power CMOS output; on high side PMOS typ.1.2Ω, on low side NMOS typ.0.4Ω
- 3) ESD resistance (Human Body Model); 8kV
- 4) Built in resistor for output current detect (phase compensation capacitor-free design)
- 5) 1.8V can be put into each control input terminal
- 6) Built-in UVLO (Under Voltage Locked Out: UVLO)
- 7) Built-in TSD (Thermal Shut Down) circuit
- 8) Standby current consumption: 0μA Typ.

3) BD6886GUL, BD6369GUL Characteristics

- 1) Ultra-small chip size package; 2.1mm × 2.1mm × 0.55mm
- 2) Low ON-Resistance Power CMOS output; on high and low sides in total typ.0.80Ω
- 3) ESD resistance (Human Body Model); 8kV
- 4) Built-in ±5% high-precision Constant-Voltage Driver (phase compensation capacitor-free design)
- 5) Control Input mode selection function
- 6) Built-in UVLO (Under Voltage Locked Out: UVLO)
- 7) Built-in TSD (Thermal Shut Down) circuit
- 8) Standby current consumption: 0μA Typ.

● Absolute Maximum Ratings (Ta=+25°C)

Parameter	Symbol	Limit				Unit
		BD6883GUL	BH6453GUL	BD6886GUL	BD6369GUL	
Power supply voltage	VCC	-0.5 to +6.5	-0.5 to +4.5	-0.5 to +6.5	-0.5 to +6.5	V
Motor power supply voltage	VM	-	-	-0.5 to +6.5	-0.5 to +6.5	V
Control input voltage	VIN	-0.5 to VCC+0.5	-0.5 to VCC+0.5	-0.5 to VCC+0.5	-0.5 to VCC+0.5	V
Input voltage for Constant-Voltage setting	VLIM	-0.5 to VCC+0.5	-	-0.5 to VM+0.5	-0.5 to VM+0.5	V
Input voltage for Constant-Current setting	CLIM	-	-0.5 to VCC+0.5	-	-	V
Power dissipation	Pd	510 ^{*1}	430 ^{*2}	730 ^{*3}	730 ^{*3}	mW
Operating temperature range	Topr	-25 to +85	-25 to +85	-25 to +85	-25 to +85	°C
Junction temperature	Tjmax	+150	+125	+150	+150	°C
Storage temperature range	Tstg	-55 to +150	-55 to +125	-55 to +150	-55 to +150	°C
H-bridge output current	Iout	-200 to +200 ^{*4}	-300 to +300 ^{*5}	-200 to +200 ^{*4}	-500 to +500 ^{*4}	mA

*1 Reduced by 4.08mW/°C over 25°C, when mounted on a glass epoxy board (50mm × 58mm × 1.75mm; 8 layers).

*2 Reduced by 4.30mW/°C over 25°C, when mounted on a glass epoxy board (50mm × 58mm × 1.75mm; 8 layers).

*3 Reduced by 5.84mW/°C over 25°C, when mounted on a glass epoxy board (50mm × 58mm × 1.75mm; 8 layers).

*4 Must not exceed Pd, ASO, or Tjmax of 150°C.

*5 Must not exceed Pd, ASO, or Tjmax of 125°C.

● Operating Conditions

Parameter	Symbol	Limit				Unit
		BD6883GUL	BH6453GUL	BD6886GUL	BD6369GUL	
Power supply voltage	VCC	+2.5 to +5.5	+2.3 to +3.6	+2.5 to +5.5	+2.5 to +5.5	V

●Function Explanation

1) Power-saving function (all series)

When the L voltage is applied the PS pin, the IC's inside circuit stop, and when 0V applied, the circuit current became 0μA(Typ.), especially.

When the IC drive, serial input while the PS pin applied H voltage. (See the electrical characteristics; P.3, 4, 5/16)

2) Control Input Pin

(I) IN pin (BD6883GUL, BH6453GUL)

The IN pin is used to program and control the motor drive modes.

(See the electrical characteristics; P3, 4/16, and the I/O Truth Table; P12/16)

(II) INA, INB, SEL pins (BD6886GUL, BD6369GUL)

The INA and INB are used to program and control the motor drive modes.

When the L voltage is applied to the SEL pin, the I/O logic can be set to EN (Enable)/IN mode, and when the H voltage is applied to the one, the I/O logic can be set to IN/IN mode. (See the electrical characteristics; P5/16, and the I/O Truth Table; P12/16)

3) H-bridge and Half-bridge on the output stage (ALL series)

Specify maximum current applied to the H-bridge and Half-bridge within the operating range, in consideration of power dissipation.

(See the Operating Conditions; P.2/16)

4) Drive system of Linear Constant-Voltage H-bridge (BD6883GUL, BD6886GUL, and BD6369GUL)

To set up the output H voltage, when the voltage input to the VLIM pin, the output H voltage is two times as high as the voltage.

(I) BD6883GUL

The output H voltage V_{OH} [V] = $2.0 \times V_{LIM}$ [V] (When V_{LIM} [V] $> \frac{V_{CC}}{2}$, Output H voltage is about VCC voltage)①

(II) BD6886GUL, BD6369GUL

The output H voltage V_{OH} [V] = $2.0 \times V_{LIM}$ [V] (When V_{LIM} [V] $> \frac{V_M}{2}$, Output H voltage is about VM voltage)②

For example, the output voltage is $2.0V \pm 5\%$, if 1.0V is applied to the VLIM pin.

If the VLIM pin is shorted to the VM pin (or the same voltage level as the VM is applied), you can be used as a Full-ON Drive H-bridge.

5) Drive system of Linear Constant-Current H-bridge (BH6453GUL)

To detect the output current and the output current settings

The BH6453GUL built in resistor for output current detect. The output current is kept constant by comparing it with the CLIM voltage. In addition, impress a highly accurate voltage form the outside of IC to the CLIM terminal, when you do the output current setting accuracy or more good.

$$\text{Output current } I_{\text{SINK}} [\text{A}] = \frac{\text{CLIM} [\text{V}]}{2 \times 2(\text{Typ}) [\Omega]} \quad \dots\dots\textcircled{3}$$

If the CLIM pin applied 0.8V, Output current is $200\text{mA} \pm 10\%$.

7) Setting of PWM signal input VLIM and CLIM terminals (all series)

It is also possible to compose filters outside the IC, change an input voltage for output voltage and output current setting terminals such as VLIM and CLIM terminals by the DUTY control using a PWM signal, etc., and use them as set values for control. In this case, however, ensure the smoothing of the signals, heeding the constant number of the low-pass filter as stated below. A cutoff frequency F_C (-3dB attenuation frequency) of the low-pass filter in Fig25 is calculated by the formula mentioned below.

$$\text{Cutoff frequency } F_C [\text{Hz}] = \frac{1}{2\pi C_{IN} (R_{INA}/R_{INB})} [\text{Hz}] \quad \dots\dots ④$$

Set the cutoff frequency F_C at 1/100 or below of the PWM frequency F_{PWM} .

For example, if the cutoff frequency F_C is set at 1/100 of F_{PWM} when the PWM frequency $F_{PWM}=50[\text{kHz}]$, according to the formula above:

$$\text{Cutoff frequency } F_C [\text{Hz}] = \frac{1}{2\pi C_{IN} (R_{INA}/R_{INB})} = \frac{1}{100} \times F_{PWM} = \frac{50 \times 10^3}{100} [\text{Hz}] \quad \dots\dots ⑤$$

When $C_{IN}=0.1[\mu\text{F}]$, according to the formula above:

$$R_{INA}/R_{INB}=3.2[\text{k}\Omega] \quad \dots\dots ⑥$$

Where, an effective value of PWM signal as a DC current, according to crest values V_{MAX} and ON DUTY [%]= $\frac{\text{ON time}}{\text{ON time} + \text{OFF time}}$ is as follows:

$$V_{PWM}[\text{V}] = V_{MAX}[\text{V}] \times \text{ON DUTY}[\%] \quad \dots\dots ⑦$$

An actual voltage V_{LIM} input to terminals that specify output current and voltages, such as VLIM and CLIM terminals is as follows according to resistance potential division of R_{INA} and R_{INB} :

$$V_{LIM}[\text{V}] = \frac{R_{INB}}{R_{INA} + R_{INB}} \times V_{PWM}[\text{V}] \quad \dots\dots ⑧$$

For example, when a PWM signal with crest values $V_{MAX}=3[\text{V}]$ and DUTY [%]=5[%] is input, a V_{LIM} value according to the formula above is:

$$V_{LIM}[\text{V}] = \frac{R_{INB}}{R_{INA} + R_{INB}} \times 3[\text{V}] \times 50[\%] \quad \dots\dots ⑨$$

(I) BD6883GUL, BD6886GUL, and BD6369GUL

Where, to specify an output voltage $VOH=2[\text{V}]$, a value $VLIM=1.0[\text{V}]$ according to the formula in the previous page. And then, according to the formula above, $VLIM=1.0[\text{V}]$.

$$VLIM=1.0[\text{V}] = V_{LIM} = \frac{R_{INB}}{R_{INA} + R_{INB}} \times 3[\text{V}] \times 50[\%]$$

Therefore, $R_{INA}=0.5R_{INB}$ ⑩

According to ⑥ and ⑩, $R_{INA}=4.8\text{k}\Omega$, $R_{INB}=9.6\text{k}\Omega$.

(II) BH6453GUL

Where, to specify an output current $I_{SINK}=100[\text{mA}]$, the following formula is derived according to the formula in the previous page ③, $CLIM=0.4[\text{V}]$, and according to the formula above ⑨:

$$CLIM=0.4[\text{V}] = V_{LIM} = \frac{R_{INB}}{R_{INA} + R_{INB}} \times 3[\text{V}] \times 50[\%]$$

$$R_{INA}=2.75R_{INB} \quad \dots\dots ⑪$$

According to ⑥ and ⑪: $R_{INA}=11.9\text{k}\Omega$, $R_{INB}=4.3\text{k}\Omega$

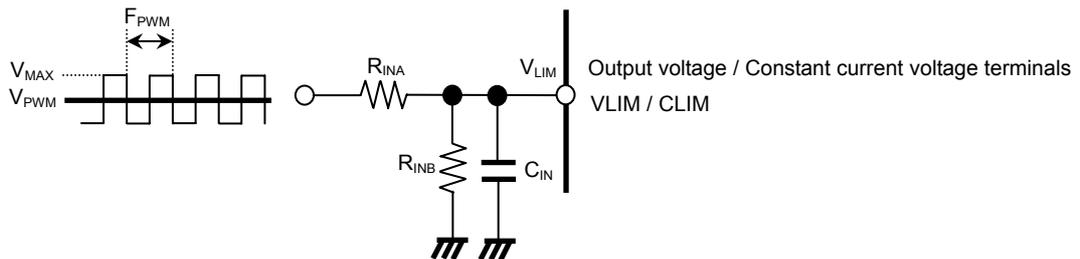

Fig.25 Example PWM signal input

● I/O Truth Table

BD6883GUL I/O Truth Table

MODE	INPUT		OUTPUT	OUTPUT MODE
	PS	IN	OUT	
-	H	L	L	Sink
		H	H	Source
-	L	X	Z ^{*7}	Standby

L: Low, H: High, X: Don't care, Z: Hi impedance

Sink is a direction of current flowing into the driver, and Source is a direction of current flowing out the driver.

When it is sink, which drive FULL ON.

*7Z at the Constant-Voltage driver output L voltage for connect feedback resistance (20kΩ Typ.) for output H voltage setting between OUT pin and GND. But output Power MOS is OFF condition.

BH6453GUL I/O Truth Table

MODE	INPUT		OUTPUT	OUTPUT MODE
	PS	IN	OUT	
-	H	H	L	Sink
		L	H	Source
-	L	X	Z	Standby

L: Low, H: High, X: Don't care, Z: Hi impedance

Sink is a direction of current flowing into the driver, and Source is a direction of current flowing out the driver.

When it is source, which drive FULL ON.

BD6886GUL, BD6369GUL I/O Truth Table

MODE	INPUT				OUTPUT		OUTPUT MODE
	PS	SEL	INA	INB	OUTA	OUTB	
EN/IN	H	L	L	X	Z ^{*7}	Z ^{*7}	Standby
			H	L	H	L	Forward rotation
			H	H	L	H	Reverse rotation
IN/IN	H	H	L	L	L	L	Brake
			L	H	L	H	Reverse rotation
			H	L	H	L	Forward rotation
			H	H	Z ^{*8}	Z ^{*8}	Standby
-	L	X	X	X	Z ^{*8}	Z ^{*8}	Standby

L: Low, H: High, X: Don't care, Z: Hi impedance

At forward rotation, current flows from OUTA to OUTB. At reverse rotation, current flows from OUTB to OUTA.

*8Z at the Constant-Voltage driver output L voltage for connect feedback resistance (20kΩ Typ.) for output H voltage setting between OUT pin and GND. But output Power MOS is OFF condition.

● Operation Notes

- 1) Absolute maximum ratings

Use of the IC in excess of absolute maximum ratings, such as the applied voltage (VCC, VM) or operating temperature range (Topr), may result in IC damage. Assumptions should not be made regarding the state of the IC (short mode or open mode) when such damage is suffered. A physical safety measure, such as a fuse, should be implemented when using the IC at times where the absolute maximum ratings may be exceeded.
- 2) Storage temperature range (Tstg)

As long as the IC is kept within this range, there should be no problems in the IC's performance. Conversely, extreme temperature changes may result in poor IC performance, even if the changes are within the above range.
- 3) Power supply and wiring

Be sure to connect the power terminals outside the IC. Do not leave them open. Because a return current is generated by a counter electromotive force of the motor, take necessary measures such as putting a Capacitor between the power source and the ground as a passageway for the regenerative current. Be sure to connect a Capacitor of proper capacitance (0.1μF to 10μF) between the power source and the ground at the foot of the IC, and ensure that there is no problem in properties of electrolytic Capacitors such as decrease in capacitance at low temperatures. When the connected power source does not have enough current absorbing capability, there is a possibility that the voltage of the power source line increases by the regenerative current and exceeds the absolute maximum rating of this product and the peripheral circuits.

Therefore, be sure to take physical safety measures such as putting a zener diode for a voltage clamp between the power source and the ground.
- 4) Ground terminal and wiring

The potential at GND terminals should be made the lowest under any operating conditions. Ensure that there are no terminals where the potentials are below the potential at GND terminals, including the transient phenomena. The motor ground terminals PGND, and the small signal ground terminal GND are not interconnected with one another inside the IC. It is recommended that you should isolate the large-current RNF pattern and PGND pattern from the small-signal GND pattern, and should establish a one-point grounding at a reference point of the set, to avoid fluctuation of small-signal GND voltages caused by voltage changes due to pattern wire resistances and large currents. Also prevent the voltage variation of the ground wiring patterns of external components. Use short and thick power source and ground wirings to ensure low impedance.
- 5) Thermal design

Use a proper thermal design that allows for a sufficient margin of the power dissipation (Pd) at actual operating conditions.
- 6) Pin short and wrong direction assembly of the device.

Use caution when positioning the IC for mounting on printed circuit boards. The IC may be damaged if there is any connection error or if positive and ground power supply terminals are reversed. The IC may also be damaged if pins are shorted together or are shorted to other circuit's power lines.
- 7) Avoiding strong magnetic field

Malfunction may occur if the IC is used around a strong magnetic field.
- 8) ASO

Ensure that the output transistors of the motor driver are not driven under excess conditions of the absolute maximum ratings and ASO.
- 9) TSD (Thermal Shut Down) circuit

If the junction temperature (Tjmax) reaches 175°C (but the BH6453GUL is 150°C), the TSD circuit will operate, and the coil output circuit of the motor will open. There is a temperature hysteresis of approximately 25°C (but the BH6453GUL is 20°C). The TSD circuit is designed only to shut off the IC in order to prevent runaway thermal operation. It is not designed to protect the IC or guarantee its operation. The performance of the IC's characteristics is not guaranteed and it is recommended that the device is replaced after the TSD is activated.
- 10) Testing an application board

When testing the IC on an application board, connecting a Capacitor to a pin with low impedance subjects the IC to stress. Always discharge Capacitors after each process or step. Always turn the IC's power supply off before connecting it to, or removing it from a jig or fixture, during the inspection process. Ground the IC during assembly steps as an antistatic measure. Use similar precaution when transporting and storing the IC.
- 11) Regarding the input pin of the IC

This monolithic IC contains P⁺ isolation and P substrate layers between adjacent elements to keep them isolated. P-N junctions are formed at the intersection of these P layers with the N layers of other elements, creating a parasitic diode or transistor. For example, the relation between each potential is as follows:

When GND > Pin A, the P-N junction operates as a parasitic diode.

When GND > Pin B, the P-N junction operates as a parasitic diode and transistor.

Parasitic elements can occur inevitably in the structure of the IC. The operation of parasitic elements can result in mutual interference among circuits, operational faults, or physical damage. Accordingly, methods by which parasitic elements operate, such as applying a voltage that is lower than the GND (P substrate) voltage to an input pin, should not be used.

- The contents described herein are correct as of June, 2008
- The contents described herein are subject to change without notice. For updates of the latest information, please contact and confirm with ROHM CO.,LTD.
- Any part of this application note must not be duplicated or copied without our permission.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams and information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO.,LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resell or otherwise dispose of the same, implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by ROHM CO., LTD. is granted to any such buyer.
- The products described herein utilize silicon as the main material.
- The products described herein are not designed to be X ray proof.

The products listed in this catalog are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys). Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.

Contact us for further information about the products.

- The contents described herein are subject to change without notice. The specifications for the product described in this document are for reference only. Upon actual use, therefore, please request that specifications to be separately delivered.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO.,LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resell or otherwise dispose of the same, no express or implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by
- ROHM CO., LTD. is granted to any such buyer.
- Products listed in this document are no antiradiation design.

The products listed in this document are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys).

Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.

It is our top priority to supply products with the utmost quality and reliability. However, there is always a chance of failure due to unexpected factors. Therefore, please take into account the derating characteristics and allow for sufficient safety features, such as extra margin, anti-flammability, and fail-safe measures when designing in order to prevent possible accidents that may result in bodily harm or fire caused by component failure. ROHM cannot be held responsible for any damages arising from the use of the products under conditions out of the range of the specifications or due to non-compliance with the NOTES specified in this catalog.

Thank you for your accessing to ROHM product informations.
