

AD7545

FEATURES

- 12-Bit Resolution
- Low Gain TC: 2 ppm/°C typ
- Fast TTL Compatible Data Latches
- Single +5 V to +15 V Supply
- Small 20-Lead 0.3" DIP and 20-Terminal Surface Mount Packages
- Latch Free (Schottky Protection Diode Not Required)
- Low Cost
- Ideal for Battery Operated Equipment

FUNCTIONAL BLOCK DIAGRAM

GENERAL DESCRIPTION

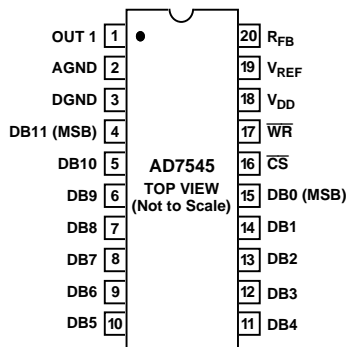

The AD7545 is a monolithic 12-bit CMOS multiplying DAC with onboard data latches. It is loaded by a single 12-bit wide word and directly interfaces to most 12- and 16-bit bus systems. Data is loaded into the input latches under the control of the \overline{CS} and \overline{WR} inputs; tying these control inputs low makes the input latches transparent, allowing direct unbuffered operation of the DAC.

The AD7545 is particularly suitable for single supply operation and applications with wide temperature variations.

The AD7545 can be used with any supply voltage from +5 V to +15 V. With CMOS logic levels at the inputs the device dissipates less than 0.5 mW for $V_{DD} = +5$ V.

NOTES

¹Temperature range as follows: J, K, L, GL versions, 0°C to +70°C; A, B, C, GC versions, –25°C to +85°C; S, T, U GU versions, –55°C to +125°C.

²This includes the effect of 5 ppm max gain TC.

³Guaranteed but not tested.

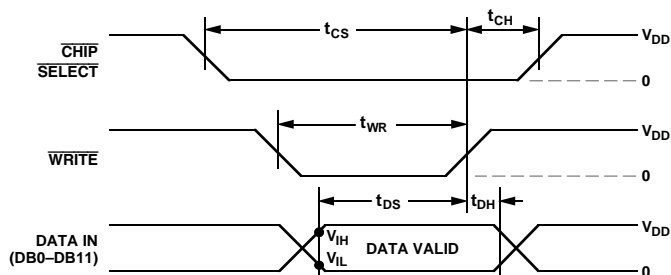

⁴DB0–DB11 = 0 V to V_{DD} or V_{DD} to 0 V.

⁵Feedthrough can be further reduced by connecting the metal lid on the ceramic package (Suffix D) to DGND.

⁶Logic inputs are MOS gates. Typical input current (+25°C) is less than 1 nA.

⁷Sample tested at +25°C to ensure compliance.

MODE SELECTION	
WRITE MODE:	HOLD MODE:
\overline{CS} AND \overline{WR} LOW, DAC RESPONDS TO DATA BUS (DB0-DB11) INPUTS.	EITHER \overline{CS} OR \overline{WR} HIGH, DATA BUS (DB0-DB11) IS LOCKED OUT; DAC HOLDS LAST DATA PRESENT WHEN \overline{WR} OR \overline{CS} ASSUMED HIGH STATE.

NOTES:
 $V_{DD} = +5V$; $t_r = t_f = 20ns$
 $V_{DD} = +15V$; $t_r = t_f = 40ns$
 ALL INPUT SIGNAL RISE AND FALL TIMES MEASURED FROM 10% TO 90% OF V_{DD} .
 TIMING MEASUREMENT REFERENCE LEVEL IS $V_{IH} + V_{IL}/2$.

*Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD7545 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

TERMINOLOGY

RELATIVE ACCURACY

The amount by which the D/A converter transfer function differs from the ideal transfer function after the zero and full-scale points have been adjusted. This is an endpoint linearity measurement.

DIFFERENTIAL NONLINEARITY

The difference between the measured change and the ideal change between any two adjacent codes. If a device has a differential nonlinearity of less than 1 LSB it will be monotonic, i.e., the output will always increase for an increase in digital code applied to the D/A converter.

PROPAGATION DELAY

This is a measure of the internal delay of the circuit and is measured from the time a digital input changes to the point at which the analog output at OUT1 reaches 90% of its final value.

DIGITAL-TO-ANALOG GLITCH IMPULSE

This is a measure of the amount of charge injected from the digital inputs to the analog outputs when the inputs change state. It is usually specified as the area of the glitch in nV secs and is measured with $V_{REF} = AGND$ and an ADLH0032CG as the output op amp, C1 (phase compensation) = 33 pF.
