DESCRIPTION

The SC5205 is a 150mA ultra low dropout linear regulator with a built in CMOS/TTL logic level enable switch, designed specifically for battery powered applications where low quiescent current and low dropout are critical for battery longevity.

The SC5205 uses a Semtech proprietary internal PNP device for the pass element, providing a low dropout voltage of 165mV at a load of 150mA, while maintaining a ground pin current of 2750 μ A.

The output noise is reduced by placing a 10nF capacitor on pin 4 (bypass).

Each device contains a bandgap reference, error amplifier, PNP pass element, thermal and current limiting circuitry and resistor divider network for setting output voltage.

The SC5205 is packaged in a 5 pin SOT-23 surface mount package for a very small footprint and it requires only a 1 μ F capacitor on the output for a minimum amount of external components.

- (1) Defined as the input to output differential at which the output voltage drops to 2% below the value measured at a differential of 1V.
- (2) As the load resistance further decreases, the SC5205 folds back the output current to approximately 150mA at $V_O = 0V$.

BLOCK DIAGRAM

APPLICATION HINTS (Refer to Sheet 1):

- (1) C_{IN} (C_1) is needed if the device is far from the supply's filter capacitors, or for operation from a battery. A value of $1.0\mu F$ or greater should be used. C_{IN} may be tantalum or aluminum electrolytic.
- (2) C_O (C_3) should be a $1\mu F$ or greater tantalum or aluminum electrolytic capacitor. Larger value capacitors will improve the overall transient response.
- (3) C_{BYP} (C_2 - required) should be placed as close as possible to pin 4 and ground. A $10nF$ ceramic capacitor is recommended.
- (4) EN should be tied to V_{IN} if the shutdown feature is not required. Maximum EN voltage = V_{IN} .
