REFERENCE DATA

(1) AQ-J Solid State Relay

1. Load current vs. ambient temperature Use load current within range specified in the figure below

Tested condition:

1) If attached to a heat sink, use a heat conductive compound (Ex. Toshiba silicone YG6111 or TSK5303) of similar coating to improve cooling

2) Without external heat sink
If the mounting surface is not metallic and a heat sink is not used, expose the bottom surface and plate surface to improve heat dissipation.

3) The current value is per 1a.

(1) 10 A type (when using heat sink or iron plate)

(2)-1. 15 A type (when using iron plate)

(2)-2. 15 A type (when using a heat sink)

(3)-1. 25 A type (when using iron plate)

(3)-2. 25 A type (when using a heat sink)

2. Non-repetitive surge current vs. carrying time

3. Input current vs. input voltage characteristics

(10A, 15A and 25A common)

(2) Output configuration: $1a \times 2$

Figure 1 is a line graph with 'Input current, mA' on the y-axis (0 to 30) and 'Input voltage, V' on the x-axis (0 to 30). Three lines represent different models:

- AQJ-12V:** A steep line starting at approximately (4, 12) and rising sharply.
- AQJ-19V:** A line starting at (10, 12) and rising linearly to (18, 24).
- AQJ-16V:** A line starting at (18, 11) and rising linearly to (28, 18).
