

## 8-Bit Buffers/Line Drivers

### Features

- Function, pinout, and drive compatible with FCT and F logic
- FCT-C speed at 4.1 ns max. (Com'l), FCT-A speed at 4.8 ns max. (Com'l)
- Reduced  $V_{OH}$  (typically = 3.3V) versions of equivalent FCT functions
- Edge-rate control circuitry for significantly improved noise characteristics
- Power-off disable feature
- ESD > 2000V

### Matched rise and fall times

### Fully compatible with TTL input and output logic levels

transmitters/receivers. The devices provide speed and drive capabilities equivalent to their fastest bipolar logic counterparts while reducing power consumption. The input and output voltage levels allow direct interface with TTL, NMOS, and CMOS devices without external components.

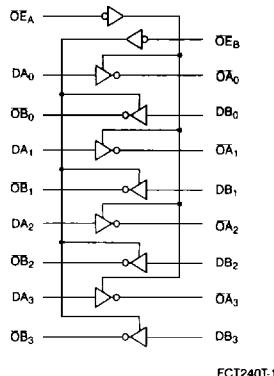

The outputs are designed with a power-off disable feature to allow for live insertion of boards.

### Functional Description

The FCT240T and FCT244T are octal buffers and line drivers designed to be employed as memory address drivers, clock drivers, and bus-oriented

**Notes:**

1. H = HIGH Voltage Level. L = LOW Voltage Level. X = Don't Care.
2. Unless otherwise noted, these limits are over the operating free-air temperature range.
3. Unused inputs must always be connected to an appropriate logic voltage level, preferably either  $V_{CC}$  or ground.
4.  $T_A$  is the "instant on" case temperature.
5. Typical values are at  $V_{CC} = 5.0\text{V}$ ,  $T_A = +25^\circ\text{C}$  ambient.
6. This parameter is guaranteed but not tested.
7. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests,  $I_{OS}$  tests should be performed last.
