

# COMPANDER ICs, FRONT END ICs AND DRIVER ICs

## COMPANDER IC FOR CORDLESS TELEPHONE

### FEATURES

- Low operating supply voltage and small consumption current make this IC suitable for its application to the sets using the battery such as the codeless telephone set. etc.

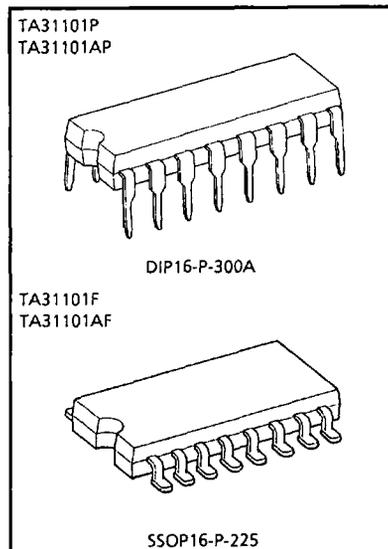

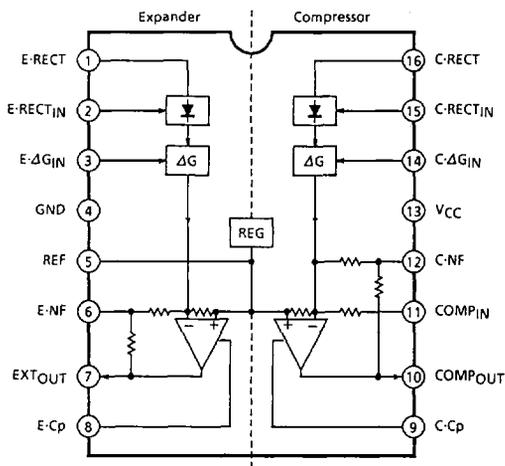

$$V_{CC}(\text{MIN}) = 1.8\text{V} \quad (T_a = 25^\circ\text{C})$$

$$I_{CCQ} = 2.7\text{mA} \quad (\text{Typ.}) \quad (V_{CC} = 3\text{V}, T_a = 25^\circ\text{C})$$

- For noise reduction, compressor and expander are incorporated into a package.
- Wide operating supply voltage range :  $V_{CC} = 1.8\sim 9\text{V}$
- Recommendable operating supply voltage :  $V_{CC} = 3\text{V}$
- Difference between TA31101P, TA31101F and TA31101AP, TA31101AF

NAME OF PRODUCT	INPUT REFERENCE LEVEL (Typ.)
TA31101P, TA31101F	- 18.5dBV
TA31101AP, TA31101AF	- 20.0dBV

# COMPANDER ICs, FRONT END ICs AND DRIVER ICs

The compressor and the expander of this IC are individually composed of the rectification circuit, the gain cell and the operation amplification circuit as shown in the figure below.

Compressor

Expander

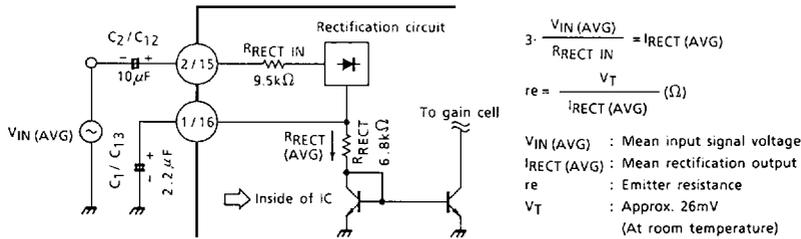

## 1. Rectification circuit

In this circuit, the feedback-type full-wave rectification circuit is applied for improving the precision of detection, and the response characteristics (attack time, recovery time) are determined by the time constant of the smoothing capacitor of the rectifying output current connected to the E-RECT terminal and the C-RECT terminal (pin 1, pin 16) and by the time constant of the internal resistance of IC.

TA31101P/F/AP/AF-2

# COMPANDER ICs, FRONT END ICs AND DRIVER ICs

- The internal resistance of E-RECT terminal and C-RECT terminal (pin 1, pin 16) becomes the series resistance of the R-RECT  $6.8\Omega$  and the emitter resistance  $r_e$  in the current miller circuit. The emitter resistance  $r_e$  of transistor varies according to the signal level as shown below.

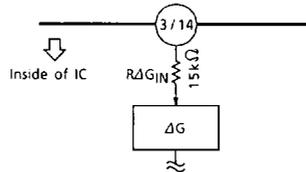

- The input resistance of the input E-RECT<sub>IN</sub> terminal and C-RECT<sub>IN</sub> terminal (pin 2, pin 15) of the rectification circuit is approximately  $9.5k\Omega$ .

## 2. Gain cell ( $\Delta G$ )

This circuit is a variable gain amplifier for controlling the gain with the rectification output current of the rectification circuit.

The input resistance of the input E- $\Delta G$ <sub>IN</sub> terminal and C- $\Delta G$ <sub>IN</sub> terminal of the gain cell (pin 3, pin 14) is approximately  $15k\Omega$ .

## 3. Operation amplification circuit

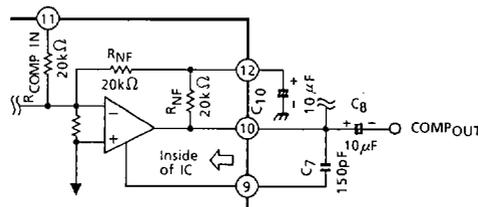

In the compressor, since the variable gain amplifier is involved in the feedback loop of the operation amplification circuit, the oscillation is liable to be generated, however, in this circuit, since the C-Cp terminal (pin 9) for phase compensation is provided, the countermeasure can be taken against the oscillation through the external capacitor.

In the compressor, for making the current gain maximum, the capacitor for decoupling the current signal is connected to the C-NF terminal (pin 12).

The cut-off frequency of the compressor is determined by the product of the capacitor  $C_{10}$  connected to the C-NF terminal multiplied by  $R_{NF}$   $20k\Omega$  of the internal resistance.

The cut-off frequency is obtained by the expression below.

$$f_c = \frac{1}{2\pi \cdot C_{10} \cdot R_{NF}}$$
