### DESCRIPTION

The 16-bit wide UT54ACS164245S MultiPurpose transceiver is built using UTMC's Commercial RadHard™ epitaxial CMOS technology and is ideal for space applications. This high speed, low power UT54ACS164245S transceiver is designed to perform multiple functions including: asynchronous two-way communication, signal buffering, voltage translation, and cold sparing. With V<sub>DD</sub> equal to zero volts, the UT54ACS164245S outputs and inputs present a minimum impedance of 1MΩ making it ideal for "cold spare" applications. Balanced outputs and low "on" output impedance make the UT54ACS164245S well suited for driving high capacitance loads and low impedance backplanes. The UT54ACS164245S enables system designers to interface 3.3 volt CMOS compatible components with 5 volt CMOS components. For voltage translation, the A port interfaces with the 3.3 volt bus; the B port interfaces with the 5 volt bus. The direction control (DIRx) controls the direction of data flow. The output enable (OE<sub>x</sub>) overrides the direction control and disables both ports. These signals can be driven from either port A or B. The direction and output enable controls operate these devices as either two independent 8-bit transceivers or one 16-bit transceiver.

### POWER TABLE

Port B	Port A	OPERATION
5 Volts	3.3 Volts	Voltage Translator
5 Volts	5 Volts	Non Translating
3.3 Volts	3.3 Volts	Non Translating

Control signals DIRx and OE<sub>x</sub> are 5 volt tolerant inputs. When V<sub>DD2</sub> is at 3.3 volts, either 3.3 or 5 volt CMOS logic levels can be applied to all control inputs. For proper operation connect power to all V<sub>DD</sub> and ground all V<sub>SS</sub> pins (i.e., no floating V<sub>DD</sub> or V<sub>SS</sub> input pins). To minimize power consumption, when either V<sub>DD1</sub> or V<sub>DD2</sub> equal to 5 volts, input voltage on inputs other than DIRx and OE<sub>x</sub> should exceed 3.15 volts. Tie unused inputs to V<sub>SS</sub>. Always insure V<sub>DD1</sub> ≥ V<sub>DD2</sub>.
