■ Performance Characteristics

Characteristics	Test Methods	Specifications												
Standard Test Condition	Electrical measurements (initial/after tests) shall be conducted at temperature of 5 to 35 °C, relative humidity of maximum 85 %	—												
Varistor Voltage	The voltage between two terminals with the specified measuring current I_{CmA} DC applied is called V_c or V_{CmA} . The measurement should be made as fast as possible to avoid heat effects.	To meet the specified value.												
Maximum Allowable Voltage	The recommended maximum sinusoidal wave voltage (rms) or the maximum DC voltage that can be applied continuously.													
Clamping Voltage	The maximum voltage between two terminals with the specified impulse current (8/20 μ s).													
Rated Power	The maximum power that can be applied within the specified ambient temperature.													
Maximum Energy	Maximum energy of less than ± 10 % of the varistor voltage change when the standard impulse (2 ms) is applied one time.													
Maximum Peak Current	Maximum current of less than ± 10 % of the varistor voltage change when impulse current (8/20 μ s) is applied twice continuously with an interval of 5 minutes.													
Temperature Coefficient of Varistor Voltage	$\frac{V_{CmA} \text{ at } 85 \text{ }^\circ\text{C} - V_{CmA} \text{ at } 25 \text{ }^\circ\text{C}}{V_{CmA} \text{ at } 25 \text{ }^\circ\text{C}} \times \frac{1}{60} \times 100(\%/^\circ\text{C})$		0 to $-0.05 \text{ }^\circ\text{C}$
