

### FEATURES

- Bidirectional I<sup>2</sup>C communication**
- Open-drain interfaces**
- Suitable for hot swap applications**
- 30 mA current sink capability**
- 1000 kHz operation**
- 3.0 V to 5.5 V supply/logic levels**
- 8-lead, RoHS-compliant SOIC package**
- High temperature operation: 125°C**
- Qualified for automotive applications**
- Safety and regulatory approvals**

- UL recognition
  - 2500 V rms for 1 minute per UL 1577
- CSA Component Acceptance Notice #5A
- VDE certificate of conformity
  - DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
  - V<sub>IORM</sub> = 560 V peak

### APPLICATIONS

- Isolated I<sup>2</sup>C, SMBus, or PMBus interfaces**
- Multilevel I<sup>2</sup>C interfaces**
- Power supplies**
- Networking**
- Power-over-Ethernet**
- Hybrid electric vehicle battery management**

### GENERAL DESCRIPTION

The ADuM1250/ADuM1251<sup>1</sup> are hot swappable digital isolators with nonlatching, bidirectional communication channels that are compatible with I<sup>2</sup>C interfaces. This eliminates the need for splitting I<sup>2</sup>C signals into separate transmit and receive signals for use with standalone optocouplers.

The ADuM1250 provides two bidirectional channels, supporting a complete isolated I<sup>2</sup>C interface. The ADuM1251 provides one bidirectional channel and one unidirectional channel for applications where a bidirectional clock is not required.

### FUNCTIONAL BLOCK DIAGRAMS

Figure 1. ADuM1250

Figure 2. ADuM1251

Both the ADuM1250 and the ADuM1251 contain hot swap circuitry to prevent glitching data when an unpowered card is inserted onto an active bus.

These isolators are based on the iCoupler<sup>®</sup> chip scale transformer technology from Analog Devices, Inc. iCoupler is a magnetic isolation technology with functional, performance, size, and power consumption advantages as compared to optocouplers. With the ADuM1250/ADuM1251, iCoupler channels can be integrated with semiconductor circuitry, which enables a complete isolated I<sup>2</sup>C interface to be implemented in a small form factor.

## SPECIFICATIONS

### ELECTRICAL CHARACTERISTICS

#### DC Specifications<sup>1</sup>

All minimum/maximum specifications apply over the entire recommended operating range, unless otherwise noted. All typical specifications are at  $T_A = 25^\circ\text{C}$ ,  $V_{DD1} = 3.3\text{ V}$  or  $5\text{ V}$ , and  $V_{DD2} = 3.3\text{ V}$  or  $5\text{ V}$ , unless otherwise noted.

Logic Low Output Voltages	$V_{SDA1OL}, V_{SCL1OL}$	600		900	mV	$I_{SDA1} = I_{SCL1} = 3.0\text{ mA}$
		600		850	mV	$I_{SDA1} = I_{SCL1} = 0.5\text{ mA}$
Input/Output Logic Low Level Difference <sup>3</sup>	$\Delta V_{SDA1}, \Delta V_{SCL1}$	50			mV	
<b>SIDE 2 LOGIC LEVELS</b>						
Logic Low Input Voltage	$V_{SDA2IL}, V_{SCL2IL}$			$0.3 V_{DD2}$	V	
Logic High Input Voltage	$V_{SDA2IH}, V_{SCL2IH}$	$0.7 V_{DD2}$			V	
Logic Low Output Voltage	$V_{SDA2OL}, V_{SCL2OL}$			400	mV	$I_{SDA2} = I_{SCL2} = 30\text{ mA}$

<sup>1</sup> All voltages are relative to their respective ground.

<sup>2</sup>  $V_{IL} < 0.5\text{ V}$ ,  $V_{IH} > 0.7\text{ V}$ .

<sup>3</sup>  $\Delta V_{S1} = V_{S1OL} - V_{S1T}$ . This is the minimum difference between the output logic low level and the input logic threshold within a given component. This ensures that there is no possibility of the part latching up the bus to which it is connected.

**AC Specifications<sup>1</sup>**

All minimum/maximum specifications apply over the entire recommended operating range, unless otherwise noted. All typical specifications are at  $T_A = 25^\circ\text{C}$ ,  $V_{DD1} = 3.3\text{ V}$  or  $5\text{ V}$ , and  $V_{DD2} = 3.3\text{ V}$  or  $5\text{ V}$ , unless otherwise noted. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

#### ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

# APPLICATIONS INFORMATION

## FUNCTIONAL DESCRIPTION

The ADuM1250/ADuM1251 interface on each side to a bidirectional I<sup>2</sup>C signal. Internally, the I<sup>2</sup>C interface is split into two unidirectional channels communicating in opposing directions via a dedicated iCoupler isolation channel for each. One channel (the bottom channel of each channel pair shown in Figure 6) senses the voltage state of the Side 1 I<sup>2</sup>C pin and transmits its state to its respective Side 2 I<sup>2</sup>C pin.

Both the Side 1 and the Side 2 I<sup>2</sup>C pins are designed to interface to an I<sup>2</sup>C bus operating in the 3.0 V to 5.5 V range. A logic low on either pin causes the opposite pin to be pulled low enough to comply with the logic low threshold requirements of other I<sup>2</sup>C devices on the bus. Avoidance of I<sup>2</sup>C bus contention is ensured by an input low threshold at SDA<sub>1</sub> or SCL<sub>1</sub> guaranteed to be at least 50 mV less than the output low signal at the same pin. This prevents an output logic low at Side 1 being transmitted back to Side 2 and pulling down the I<sup>2</sup>C bus.

Because the Side 2 logic levels/thresholds are standard I<sup>2</sup>C values, multiple ADuM1250/ADuM1251 devices connected to a bus by their Side 2 pins can communicate with each other and with other I<sup>2</sup>C-compatible devices. A distinction is made between I<sup>2</sup>C compatibility and I<sup>2</sup>C compliance. I<sup>2</sup>C compatibility refers to situations in which the logic levels of a component do not necessarily meet the requirements of the I<sup>2</sup>C specification but still allow the component to communicate with an I<sup>2</sup>C-compliant device. I<sup>2</sup>C compliance refers to situations in which the logic levels of a component meet the requirements of the I<sup>2</sup>C specification.

However, because the Side 1 pin has a modified output level/ input threshold, this side of the ADuM1250/ADuM1251 can communicate only with devices that conform to the I<sup>2</sup>C standard. In other words, Side 2 of the ADuM1250/ADuM1251 is I<sup>2</sup>C-compliant, whereas Side 1 is only I<sup>2</sup>C-compatible.

The output logic low levels are independent of the V<sub>DD1</sub> and V<sub>DD2</sub> voltages. The input logic low threshold at Side 1 is also independent of V<sub>DD1</sub>. However, the input logic low threshold at Side 2 is designed to be at 0.3 V<sub>DD2</sub>, consistent with I<sup>2</sup>C requirements. The Side 1 and Side 2 pins have open-collector outputs whose high levels are set via pull-up resistors to their respective supply voltages.

Figure 6. ADuM1250 Block Diagram

## STARTUP

Both the V<sub>DD1</sub> and V<sub>DD2</sub> supplies have an undervoltage lockout feature to prevent the signal channels from operating unless certain criteria are met. This feature prevents input logic low signals from pulling down the I<sup>2</sup>C bus inadvertently during power-up/power-down.

For the signal channels to be enabled, the following two criteria must be met:

- Both supplies must be at least 2.5 V.
- At least 40 μs must elapse after both supplies exceed the internal startup threshold of 2.0 V.

Until both criteria are met for both supplies, the ADuM1250/ADuM1251 outputs are pulled high, ensuring a startup that avoids any disturbances on the bus. Figure 7 and Figure 8 illustrate the supply conditions for fast and slow input supply slew rates.

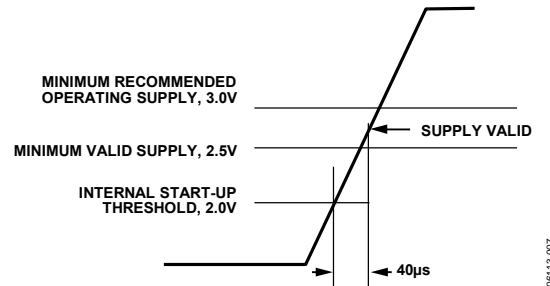

Figure 7. Start-Up Condition, Supply Slew Rate > 12.5 V/ms

## TYPICAL APPLICATION DIAGRAM

Figure 9 shows a typical application circuit including the pull-up resistors required for both Side 1 and Side 2 buses. Bypass capacitors with values from 0.01 μF to 0.1 μF are required between V<sub>DD1</sub> and GND<sub>1</sub> and between V<sub>DD2</sub> and GND<sub>2</sub>. The 200 Ω resistor shown in Figure 9 is required for latch-up immunity if the ambient temperature can be between 105°C and 125°C.

**MAGNETIC FIELD IMMUNITY**

The ADuM1250/ADuM1251 are extremely immune to external magnetic fields. The limitation on the magnetic field immunity of the ADuM1250/ADuM1251 is set by the condition in which induced voltage in the receiving coil of the transformer is sufficiently large to either falsely set or reset the decoder. The following analysis defines the conditions under which this may occur. The 3 V operating condition of the ADuM1250/ADuM1251 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1.0 V. The decoder has a sensing threshold at approximately 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt) \sum \pi r_n^2; n = 1, 2, \dots, N$$

where:

$\beta$  is the magnetic flux density (gauss).

$r_n$  is the radius of the  $n^{\text{th}}$  turn in the receiving coil (cm).

$N$  is the total number of turns in the receiving coil.

Given the geometry of the receiving coil in the ADuM1250/ADuM1251 and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 10.

Figure 10. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This voltage is approximately 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse (and is of the worst-case polarity), it reduces the received pulse from >1.0 V to 0.75 V—still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances away from the ADuM1250/ADuM1251 transformers. Figure 11 expresses these allowable current magnitudes as a function of frequency for selected distances. As shown in Figure 11, the ADuM1250/ADuM1251 are extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example, a 0.5 kA current placed 5 mm away from the ADuM1250/ADuM1251 is required to affect the operation of the component.

Note that at combinations of strong magnetic field and high frequency, any loops formed by PCB traces can induce error voltages sufficiently large to trigger the thresholds of succeeding circuitry. Exercise care in the layout of such traces to avoid this possibility.

## AUTOMOTIVE PRODUCTS

The [ADuM1250W](#) and [ADuM1251W](#) models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
