

32-bit RISC Microcontroller

CMOS

FR20 Series MB91103**MB91103****■ DESCRIPTION**

The MB91103 is a standard single-chip microcontroller constructed around the 32-bit RISC CPU (FR20 Series) core with abundant I/O resources and bus control functions optimized for high-performance/high-speed CPU processing for embedded controller applications. To support the vast memory space accessed by the 32-bit CPU, the MB91103 normally operates in the external bus access mode and executes instructions on the internal 1 KB cache memory for enhanced performance.

The MB91103 is optimized for applications requiring high-performance CPU processing such as navigation systems, high-performance FAXs and printer controllers.

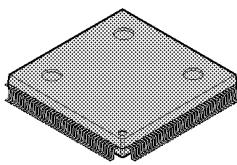

■ FEATURES**FR20CPU**

- 32-bit RISC, load/store architecture, 5-stage pipeline
- Operating clock frequency: 25 MHz
- General purpose registers: 32-bit × 16
- 16-bit fixed length instructions (basic instructions), 1 instruction/1 cycle
- Memory to memory transfer, bit processing, barrel shifter processing: Optimized for embedded applications
- Function entrance/exit instructions, multiple load/store instructions of register contents, instruction systems supporting high level languages
- Register interlock functions, efficient assembly language coding
- Branch instructions with delay slots: Reduced overhead time in branch executions
- Internal multiplier/Supported at instruction level
 - Signed 32-bit multiplication: 5 cycles
 - Signed 16-bit multiplication: 3 cycles
- Interrupt (push PC and PS): 6 cycles, 16 priority levels

(Continued)

■ PACKAGE

160-pin Plastic QFP

(FPT-160P-M03)

MB91103 Series

(Continued)

Bus interface

- 24-bit address bus (16 MB memory space)
- 32-bit/16-bit/8-bit data bus
- Basic external bus cycle: 2 clock cycles
- Chip select outputs for setting down to a minimum memory block size of 64 K bytes: 6
- Interface supported for various memory technologies
 - Time sharing input/output of data/address (area 1)
 - DRAM interface (area 4 and 5)
- Automatic wait cycle insertion: Flexible setting, from 0 to 7 for each area
- Parity check function: Generates parity error interrupt
- Unused data/address pins can be configured as input/output ports
- Little endian mode supported (Select 1 area from area 1 to 5)

DRAM interface

- 2 banks independent control (area 4 and 5)
- Normal mode/high speed page mode
- Basic bus cycle: Normally 5 cycles, 2-cycle access possible in high speed page mode
- Programmable waveform: Automatic 1-cycle wait insertion to RAS and CAS cycles
- DRAM refresh
 - CBR refresh (interval time configurable by 6-bit timer)
 - Self-refresh mode
- Supports 8-bit/9-bit/10-bit/12-bit column address width
- 2CAS/1WE, 2WE/1CAS selective

Cache memory

- 1 KB instruction cache memory
- 2 way set associative
- 32 blocks/way, 4 entries (4 words)/block

DMAC (DMA Controller)

- 5 channels
- External to external 2.5 access cycle/transfer (when 2 clock cycles = 1 access cycle)
- Internal to external 1.5 access cycle/transfer (when 2 clock cycles = 1 access cycle)
- Address registers (inc, dec and reload executable), 32-bit × 2, 16-bit × 6
- Transfer count register (reload executable), 16-bit × 2, 8-bit × 3
- Transfer incident/external pins/internal resource interrupt requests/software interrupts
- Transfer sequence: Step transfer/block transfer/burst transfer/continuous transfer/cycle steal transfer (for ch. 0 and ch. 1 only)
- Transfer data length: 8-bit/6-bit/32-bit selective
- Command chain operation possible
- NMI/interrupt request enables temporary stop operation

UART

- 2 independent channels
- Full-duplex double buffer
- Data length: 7-bit to 9-bit (non-parity), 6-bit to 8-bit (parity)
- Asynchronous (start-stop system), CLK-synchronized communication selective
- Multi-processor mode
- Internal 16-bit timer operating as a proprietary baud rate generator: Generates any given baud rate
- Use external clock can be used as a transfer clock
- Error detection: Parity, frame, overrun

(Continued)

Extended I/O serial interface

- Inputs/outputs 8-bit data in serial format
- LSB first/MSB first selective
- Shift clock internal generation/external input selective

A/D converter (successive approximation type)

- 10-bit resolution, 8 channels
- Successive approximation type: Conversion time of 5.6 µs at 25 MHz
- Internal sample and hold circuit
- Conversion mode: Single conversion/scanning conversion/repeated conversion selective
- Start: Software/external trigger/internal timer selective

Reload timer

- 16-bit timer: 2 channels
- Internal clock: 2 clock cycle resolution, divide by 2/8/32 selective
- Pin input: Event counter input/gate function
- Square wave output

Up/down counter

- 16-bit timer: 2 channels
- Timer mode/up/down counter mode/phase shift count mode
- Pin input activates counter clear/gate function

Other interval timers

- 16-bit timer: 2 channels (U-TIMER), 1 channel (free run for ICU/OCU)
- Watch-dog timer: 1 channel

Input capture/output compare

- Capture: 4 channels, compare: 8 channels
- Count can be cleared on compare match
- 16-bit unified free-run timer embedded

Bit search module

- First bit transition “1”/“0” from MSB can be detected in 1 cycle

Interrupt controller

- External interrupt input: Non-maskable interrupt (NMI), normal interrupt ×8 (INT0 to INT7)
- Internal interrupt incident: Parity error, UART, DMAC, A/D, reload timer, up/down counter, capture/compare, baud rate timer, extended serial I/O, free-run timer and delayed interrupt
- Priority levels of interrupts are programmable in 16 steps (except for non-maskable interrupt)

Others

- Reset cause: Power-on reset/watch-dog timer/software reset/external reset
- Low power consumption mode
Sleep mode/stop mode
- Clock gear function
Operating clocks for CPU and peripherals are independently selective
Gear clock can be selected from 1/1, 1/2, 1/4 and 1/8 (or 1/2, 1/4, 1/8 and 1/16)
- Package
QFP-160
- CMOS technology (0.65 µm), operating voltage 5.0 V ±10%

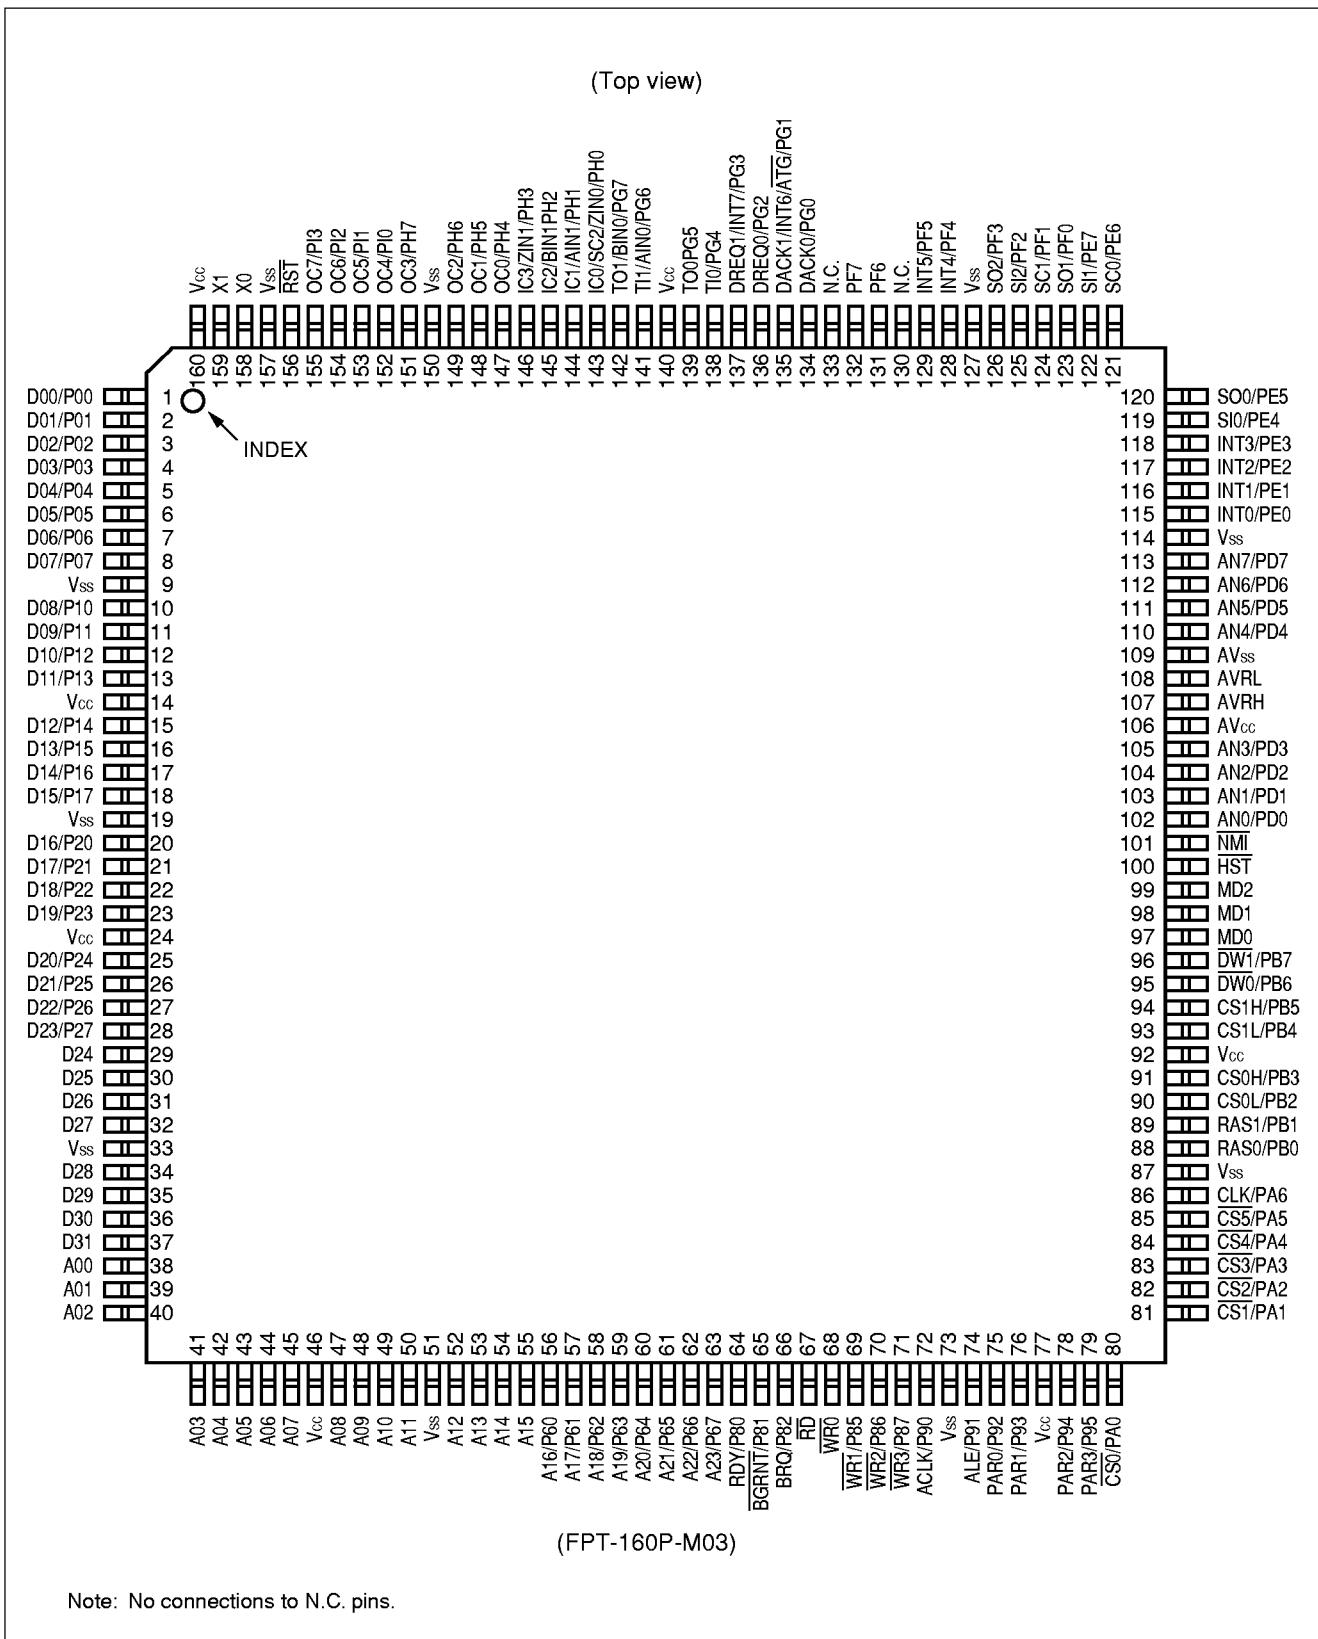

MB91103 Series

■ PRODUCT LINEUP

Product Items	MB91103	MB91V100
Instruction cache	1 KB fixed	Max. 4 KB (4 KB/2 KB/1 KB/512 B selective)
DMAC	5 channels (ch. 0, ch. 1, ch. 4, ch. 5 and ch. 6 only) Address register (32-bit length) × 2 (DMAAR 0, DMAAR 1) Address register (16-bit length) × 6 (DMAAR 2 to DMAAR 7) Transfer count register (16-bit length) × 2 (DMACT 0, DMACT 1) Transfer count register (8-bit length) × 3 (DMACT 4 to DMACT 6) Channels for cycle steal operation: 2 channels (ch. 0, ch. 1) 19 internal transfer causes	8 channels 32-bit length × 4 (DMAAR 0 to DMAAR 3) 16-bit length × 4 (DMAAR 4 to DMAAR 7) 16-bit length × 4 (DMACT 0 to DMACT 3) 8-bit length × 4 (DMACT 4 to DMACT 7) 4 channels (ch. 0 to ch. 3) 23 internal interrupt causes
U-TIMER	2 channels	3 channels
UART	2 channels	3 channels
External interrupts	8 channels (INT0 to INT7)	12 channels (INT0 to INT11)
Timer units		Incorporated
DSP unit		Incorporated
Pin conditions in each state	PG 4 to PG 7 are fixed to 0 when CPU stops	Configured as input when CPU stops

MB91103 Series

■ PIN ASSIGNMENT

MB91103 Series

■ PIN DESCRIPTION

Pin No.	Pin name	Circuit type	Function
QFP*			
158	X0	A	Clock (Oscillator) input
159	X1		Clock (Oscillator) output
97 to 99	MD0 to MD2	G	Mode pins 0 to 2 Input pins for operation mode specification. Directly connect these pins with V _{CC} or V _{SS} for use.
156	RST	B	External reset input.
1 to 8	D00 to D07	J	Bit 0 to bit 7 of external data bus.
	P00 to P07		I/O port. This function is available when external data bus width is set to 8-bit or 16-bit.
10 to 13, 15 to 18	D08 to D15	J	Bit 8 to bit 15 of external data bus.
	P10 to P17		I/O port. This function is available when external data bus width is set to 8-bit or 16-bit.
20 to 23, 25 to 28	D16 to D23	J	Bit 16 to bit 23 of external data bus.
	P20 to P27		I/O port. This function is available when external data bus width is set to 8-bit.
29 to 32, 34 to 37	D24 to D31	J	Bit 24 to bit 31 of external data bus.
38 to 45, 47 to 50, 52 to 55	A00 to A15	C	Bit 0 to bit 15 of external address bus.
56 to 63	A16 to A23	C	Bit 16 to bit 23 of external address bus.
	P60 to P67		Can be configured as I/O ports when not used as address bus.
64	RDY	J	External ready input. Outputs "L" level bus cycle is being executed and not completed.
	P80		Can be configured as I/O port.
65	BGRNT	C	External bus release acknowledge output. Outputs "L" level when external bus is released.
	P81		Can be configured as I/O port.
66	BRQ	J	External bus release request input. Input "H" level when release of external bus is required.
	P82		Can be configured as I/O port.
67	RD	C	Read strobe output pin for external bus.
68	WR0	C	Write strobe output pin for external bus.

MB91103 Series

Pin No.	Pin name	Circuit type	Function
QFP*			
94	CS1H	C	CASH output for DRAM bank 1.
	PB5		Can be configured as I/O port.
95	DW0	C	WE output for DRAM bank 0. ("L" active)
	PB6		Can be configured as I/O port.
96	DW1	C	WE output for DRAM bank 1. ("L" active)
	PB7		Can be configured as I/O port.
100	HST	H	Directly connects this pin with V _{cc} for use.
101	NMI	H	NMI (non-maskable interrupt pin) input pin. ("L" active)
102 to 105	AN0 to AN3	D	Analog input pins of A/D converter. This function is available when AIC register is set to specify analog input mode.
	PD0 to PD3		General-purpose I/O ports. This function is available when AIC register is set to configure I/O ports.
110 to 113	AN4 to AN7	D	Analog input pins of A/D converter. This function is available when AIC register is set to specify analog input mode.
	PD4 to PD7		General-purpose I/O ports. This function is available when AIC register is set to configure I/O ports.
115 to 118	INT0 to INT3	I	External interrupt request input pins. This pin is used for input during corresponding interrupt is enabled, and it is necessary to disable output for other functions from this pin unless such output is made intentionally. INT0 and INT1 can be used as a DMA request when DMAC is so configured.
	PE0 to PE3		General-purpose I/O port.
119	SI0	F	Data input pin for extended serial I/O interface (SIO). This pin is used for input during SIO is in operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PE4		General-purpose I/O port.
120	SO0	C	Data output for extended serial I/O interface (SIO). This function is available when serial data output specification of SIO is enabled.
	PE5		General-purpose I/O port. This function is available when serial data output of extended serial I/O interface (SIO) is disabled.
121	SC0	F	Clock input/output pin for extended serial I/O interface. Clock output is valid when clock output of SIO is enabled.
	PE6		General-purpose I/O port. This function is available when clock output of SIO is enabled.

QFP*			
122	SI1	F	UART0 data input pin. This pin is used for input during UART0 is in input operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PE7		General-purpose I/O port.
123	SO1	C	UART0 data output pin. This function is available when UART0 data output is enabled.
	PF0		General-purpose I/O port. This function is available when serial data output of UART0 is disabled.
124	SC1	F	UART0 clock I/O pin. This function is available when UART0 clock output is enabled.
	PF1		General-purpose I/O port. This function is available when UART0 clock output is disabled.
125	SI2	F	UART1 data input pin. This pin is used for input during UART1 is in input operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PF2		General-purpose I/O port.
126	SO2	C	UART1 data output pin. This function is available when UART1 data output is enabled.
	PF3		General-purpose I/O port. This function is available when UART1 data output is disabled.
128, 129	INT4, INT5	I	External interrupt request input pins. These pins are used for input during corresponding interrupt is enabled, and it is necessary to disable output for other functions from these pins unless such output is made intentionally.
	PF4, PF5		General-purpose I/O ports.
131, 132	PF6, PF7	E	I/O ports of open-drain type.
134	DACK0	C	Transfer request acknowledge output pin for DMAC (ch. 0). This function is available when transfer request output for DMAC is enabled.
	PG0		General-purpose I/O port. This function is available when transfer request for DMAC is disabled.

Pin No.	Pin name	Circuit type	Function
QFP*			
135	DACK1	I	External transfer request acknowledge output pin for DMAC (ch. 1). This function is available when transfer request output for DMAC is enabled.
	INT6		External interrupt request input pins. This pin is used for input during corresponding interrupt is enabled, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	ATG		External trigger input pin for A/D converter. This pin is used for input when external trigger is selected to cause A/D converter operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PG1		General-purpose I/O port. This function is available when transfer request acknowledge for DMAC is disabled.
136	DREQ0	F	External transfer request input pin for DMA (ch. 0). This pin is used for input when external trigger is selected to cause DMAC operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PG2		General-purpose I/O port.
137	DREQ1	I	External transfer request input pin for DMA (ch. 1). This pin is used for input when external trigger is selected to cause DMAC operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	INT7		External interrupt request input pins. This pin is used for input during corresponding interrupt is enabled, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PG3		General-purpose I/O port.
138	TIO	F	Input pin for reload-timer 0. This pin is used for input when input to reload-timer 0 is enabled, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
	PG4		General-purpose I/O port.
139	TO0	F	Output pin for reload-timer 0. This function is available when output from reload-timer is enabled.
	PG5		General-purpose I/O port. This function is available when output from reload-timer is disabled.

153	OC5	K	Output pin for output compare 5 (OCU5). This function is available when output of corresponding OCU is enabled.
	PI1		General-purpose I/O port. This function is available when output of corresponding OCU is disabled.
154	OC6	K	Output pin for output compare 6 (OCU6). This function is available when output of corresponding OCU is enabled.
	PI2		General-purpose I/O port. This function is available when output of corresponding OCU is disabled.
155	OC7	F	Output pin for output compare 7 (OCU7). This function is available when output of corresponding OCU is enabled.
	PI3		General-purpose I/O port. This function is available when output of corresponding OCU is disabled.
130, 133	N.C.	—	No connections allowed to this pin.
14, 24 46, 77 92, 140 160	V _{cc}	—	Power supply pin (V _{cc}) for digital circuit
9, 19 33, 51 73, 87 114, 127 150, 157	V _{ss}	—	Earth level (V _{ss}) for digital circuit.
106	A _V _{cc}	—	Power supply pin (V _{cc}) for A/D converter.
107	A _V RH	—	Reference voltage input (High) for A/D converter. Make sure to turn on and off this pin with potential of AVRH or more applied to V _{cc} .
108	A _V L	—	Reference voltage input pin (Low) for A/D converter.
109	A _V _{ss}	—	Power supply pin (V _{ss}) for A/D converter.

* : FPT-160P-M03

Note: In most of the above pins, I/O port and resource I/O are multiplexed e.g. P82 and BRQ. In case of conflict between output of I/O port and resource I/O, priority is always given to the output of resource I/O.

■ HANDLING DEVICES

1. Preventing Latchup

In CMOS ICs, applying voltage higher than V_{CC} or lower than V_{SS} to input/output pin or applying voltage over rating across V_{CC} and V_{SS} may cause latchup.

This phenomenon rapidly increases the power supply current, which may result in thermal breakdown of the device. Make sure to prevent the voltage from exceeding the maximum rating.

For the same reason, make sure to prevent the analog power supply voltage (AV_{CC} , AV_R) and analog input from exceeding the digital power supply voltage when turning on/off the device.

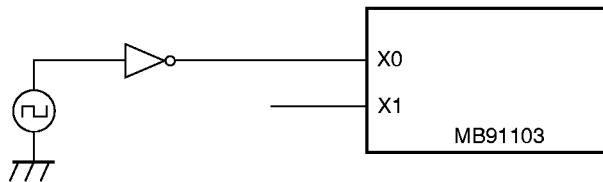

2. Treatment of Unused Pins

Unused pins left open may cause malfunctions. Make sure to connect them to pull-up or pull-down resistors.

3. Remarks for External Clock Operation

When external clock is selected, stabilization time is necessary at the time of power reset (optional) or wakening up from stop mode.

- Using an External Clock

4. Power Supply Pins

When there are several V_{CC} and V_{SS} pins, each of them is geometrically connected to its counterpart inside of the device, minimizing the risk of malfunctions such as latch up. To further reduce the risk of malfunctions, to prevent EMI radiation, to prevent strobe signal malfunction resulting from creeping-up of ground level and to observe the total output current standard, connect each pin directly to V_{CC} or V_{SS} outside of the device.

It is preferred to connect V_{CC} and V_{SS} of this device to power supply with minimal impedance possible.

It is also recommended to connect a bypass capacitor of about $0.1 \mu F$ between V_{CC} and V_{SS} at a position as close as possible to this device.

5. Crystal Oscillator Circuit

Noises around X0 and X1 pins may cause malfunctions of this device. In designing the PC board, lay out X0, X1 and crystal oscillator (or ceramic oscillator) and bypass capacitor for grounding as close as possible. Prevent their wiring from being crossed by other wires.

It is strongly recommended to design PC board so that X1 and X0 pins are surrounded by grounding area for stable operation.

6. Turning-on Sequence of A/D Converter Power Supply and Analog Input

Make sure to turn on the digital power supply (V_{CC}) before turning on the A/D converter (AV_{CC} , $AVRH$, $AVRL$) and applying voltage to analog input (AN0 to AN7).

Make sure to turn off digital power supply after power supply to A/D converters and analog inputs have been switched off. (There are no such limitations in turning on power supplies. Analog and digital power supplies may be turned on simultaneously.) Make sure that $AVRH$ never exceeds AV_{CC} when turning on/off power supplies.

7. Treatment of N.C. Pins

Make sure to leave N.C. (internal connection) pins open.

8. Fluctuation of Power Supply Voltage

Warranty range for normal operation against fluctuation of power supply voltage is as given in rating. However, sudden fluctuation of power supply voltage within the warranty range may cause malfunctions. It is recommended to make every effort to stabilize the power supply voltage.

9. Mode Setting Pins

Connect mode setting pins (MD0 to MD2) directly to V_{CC} or V_{SS} .

Arrange each mode setting pin and V_{CC} or V_{SS} patterns on the printed circuit board as close as possible and make the impedance between them minimal to prevent mistaken entrance to the test mode caused by noises.

10. External Reset Input

Keep the \overline{RST} pin level at "L" for at least 5 machine cycles to ensure proper reset operation.

11. I/O Access Limmitations When Using Gear Function

In MB91103 series, there are some limmitations concerning about accesses to the I/O area.

Limited I/O area: $0X10_H$ to $0XFF_H$
 $0X400_H$ to $0X5FF_H$

Clock gear combinations:

Peripheral system CPU system	1/1	1/2	1/4	1/8
1/1	○	△	△	△
1/2	△	○	△	△
1/4	○	△	○	△
1/8	○	○	△	○

○ : Without limitation

△ : Limited

In the limited clock gear combination shown in the above table, there are limitations concerning about accesses to the applicable I/O area as below.

- (1) When accessing to the I/O area, use only 16-bit length instruction or 8-bit length instruction.
- (2) When putting the read-out instruction from the applicable I/O area right after the write-in instruction to the same I/O area, put the dummy read-out instruction from the same area.

MB91103 Series

(Example) ; r1, r2, r4 are the applicable I/O areas

sth r 0, @r1 ; Write-in instruction

lduh @r4, r 3 ; Dummy read-out instruction : add this instruction

lduh @r2, r 3 ; Target read-out insturction

0x400 address is recomendable for the dummy read-out instruction address. As interrupting controllers ICR00 and ICR01 are put in this address, there is no bad influence owing to dummy read-out operations.

12. DMAC Limitations When Using Gear Function

In MB91103 series, UART operated in synclonizing transfer mode must not be DMA transfer facter.

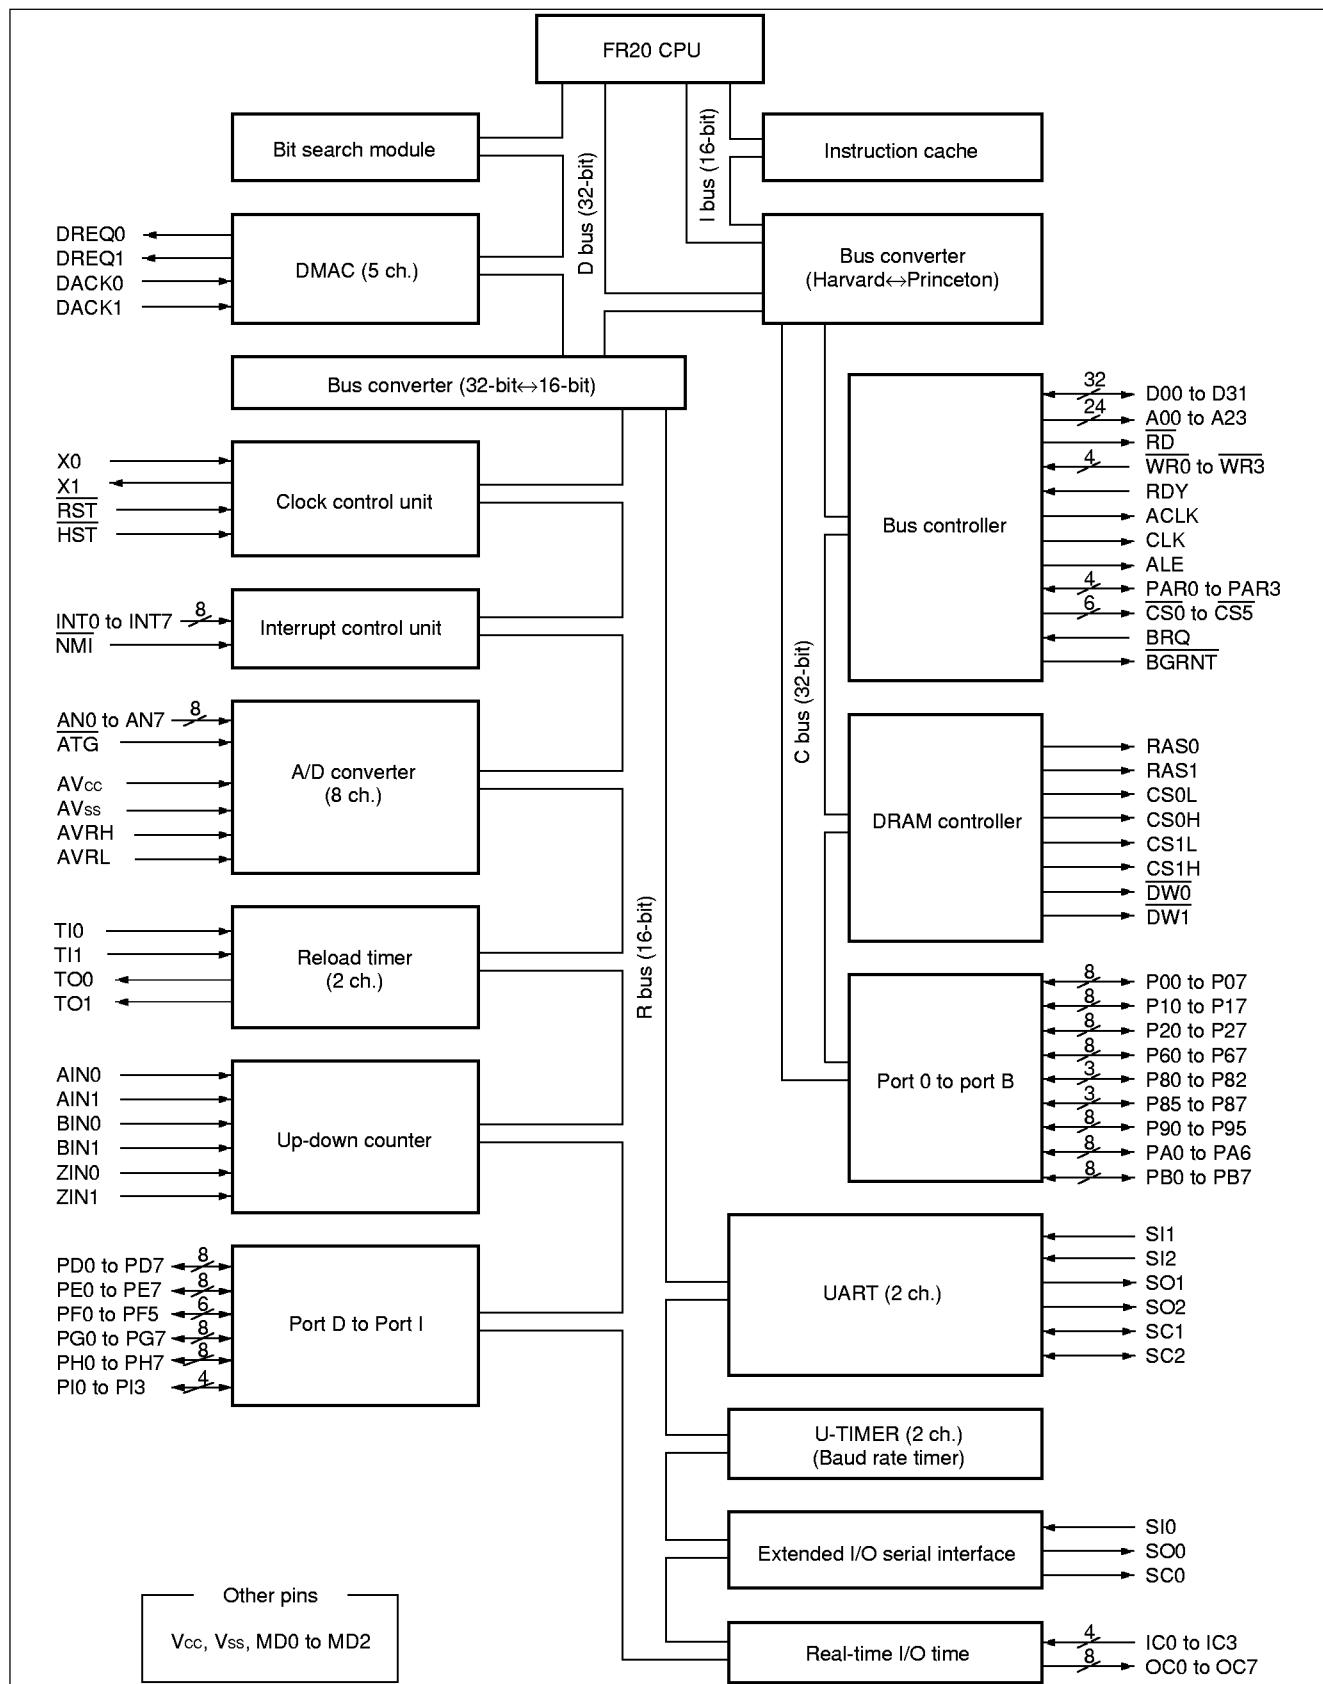

Clock gear combinations:

Peripheral system CPU system \	1/1	1/2	1/4	1/8
1/1	○	○	○	○
1/2	×	○	○	○
1/4	×	×	○	○
1/8	×	×	×	○

○ : Without limitation

× : Prohibite to use

■ BLOCK DIAGRAM

MB91103 Series

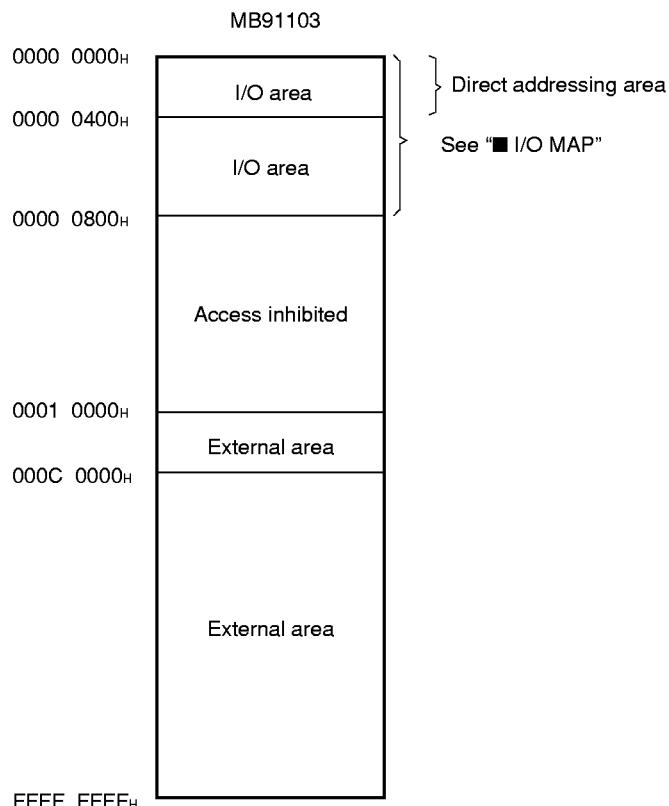

■ CPU CORE

1. Memory Space

The FR20 series has a logical address space of 4 G bytes (2^{32} bytes) and the CPU linearly accesses the memory space.

The MB91103 has no internal memories (RAM, ROM).

- **Memory space**

- **Direct addressing area**

The following areas on the memory space are assigned to direct addressing area for I/O. In these areas, an address can be specified in a direct operand of a code.

Direct areas consists of the following areas dependent on accessible data sizes.

Byte data access: 0 to 0FF_H

Half word data access: 0 to 1FF_H

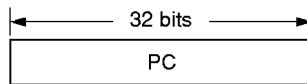

Word data access: 0 to 3FF_H

2. Registers

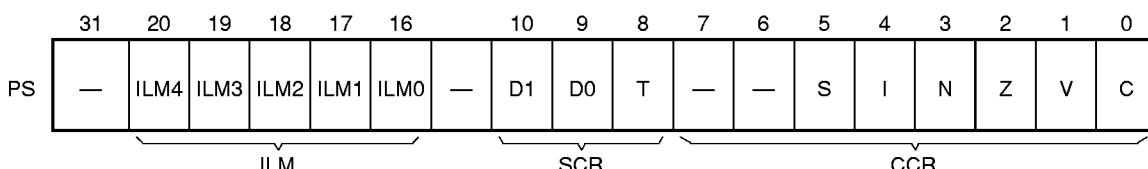

The FR20 series has two types of registers -- dedicated registers embedded on the CPU and general-purpose registers on memory.

- Dedicated registers

Program counter (PC)	: 32-bit length, indicates the location of the instruction to be executed
Program status (PS)	: 32-bit length, register for storing register pointer or condition codes
Table base register (TBR)	: Holds top address of vector table used in EIT (Exceptional/Interrupt/Trap) processing.
Return pointer (RP)	: Holds address to resume operation after returning from a subroutine.
System stack pointer (SSP)	: Indicates system stack space.
User's stack pointer (USP)	: Indicates user's stack space.
Multiplication/Division result register (MDH/MDL)	: 32-bit length, register for multiplication/division.

32 bits		
	Program counter	Initial value XXXX XXXX _H not fixed
	Program status	
	Table base register	000F FC00 _H
	Return pointer	XXXX XXXX _H not fixed
	System stack pointer	0000 0000 _H
	User's stack pointer	XXXX XXXX _H not fixed
	Multiplication/division result register	XXXX XXXX _H not fixed
		XXXX XXXX _H not fixed

The PS register is for holding program status and consists of a condition code register (CCR), a system condition code register (SCR) and a level mask register (ILM).

MB91103 Series

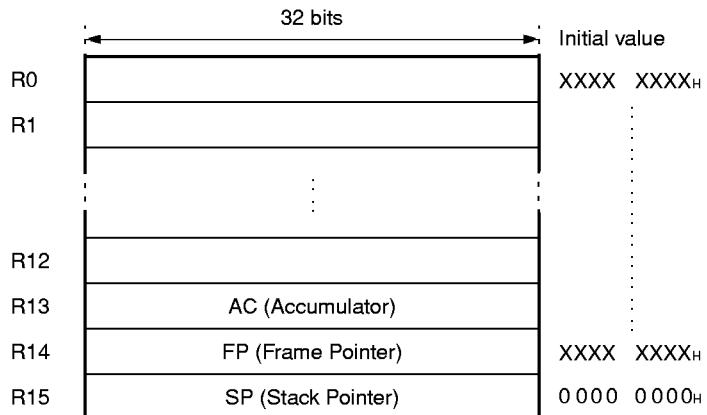

- Condition code register (CCR)
 - S flag : Specifies a stack pointer used as R15.
 - I flag : Controls user interrupt request enable/disable.
 - N flag : Indicates sign bit when division result is assumed to be in the 2's complement format.
 - Z flag : Indicates whether or not the result of division was "0".
 - V flag : Assume the operand used in calculation in the 2's complement format and indicates whether or not overflow has occurred.
 - C flag : Indicates if a carry or borrow from the MSB has occurred.
- System condition code register (SCR)
 - T flag : Specifies whether or not to enable step trace trap.
- Interrupt level mask register (ILM)
 - ILM4 to ILM0 : Register for holding interrupt level mask value. The value held by this register is used as a level mask. When an interrupt request issued to the CPU is higher than the level held by ILM, the interrupt request is accepted.

ILM4	ILM3	ILM2	ILM1	ILM0	Interrupt level	Priority
0	0	0	0	0	0	High
		⋮			⋮	
0	1	0	0	0	15	
		⋮			⋮	
1	1	1	1	1	31	Low

■ GENERAL-PURPOSE REGISTERS

R0 to R15 are general-purpose registers embedded on the CPU. These registers functions as an accumulator and a memory access pointer (field for indicating address). User can specify the functions of the registers.

- Register bank structure

Of the above 16 registers, following registers have special functions. To support the special functions, part of the instruction set has been sophisticated to have enhanced functions.

R13: Virtual accumulator (AC)

R14: Frame pointer (FP)

R15: Stack pointer (SP)

Upon reset, values in R0 to R14 are not fixed. Value in R15 is initialized to be 00000000_H (SSP value).

MB91103 Series

■ SETTING MODE

1. Pin

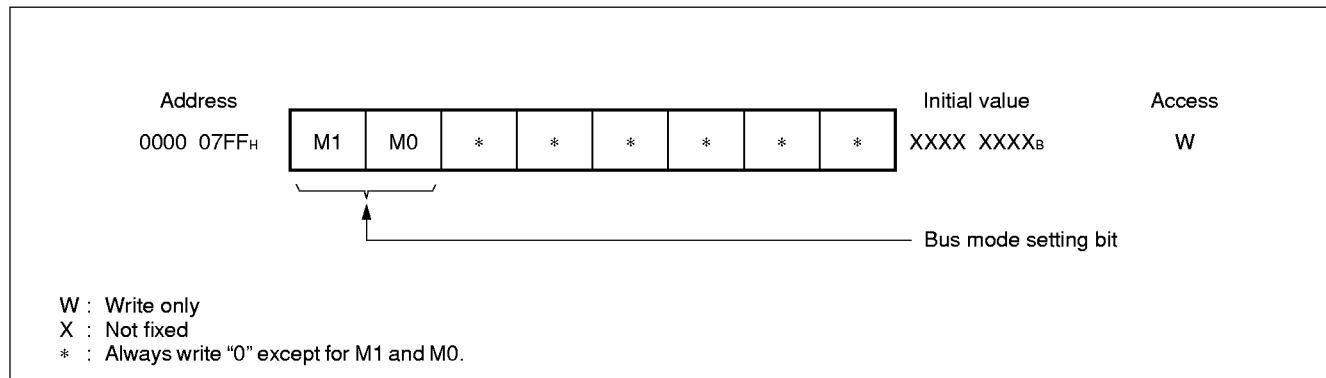

- Mode setting pins and modes

Mode setting pins			Mode name	Reset vector access area	External data bus width	Bus mode
MD2	MD1	MD0				
0	0	0	External vector mode 0	External	8 bits	External ROM External bus mode
0	0	1	External vector mode 1	External	16 bits	
0	1	0	External vector mode 2	External	32 bits	
0	1	1	Internal vector mode	Internal	(Mode register)	Single-chip mode*
1	—	—	—	—	—	Inhibited

* : MB91103 does not support single-chip mode.

2. Registers

- Mode setting registers and modes

- Bus mode setting bits and functions

M1	M0	Functions	Note
0	0	Single-chip mode	
0	1	Internal ROM external bus mode	
1	0	External ROM External bus mode	
1	1	—	Inhibited

Note: For a device without internal ROM, set "10B" only.

MB91103 allows "10B" setting only.

*1: ICR sets an interrupt level corresponding to the interrupt request into a register provided in the interrupt controller.
ICR is provided for each interrupt request.

*2: Vector addresses are given by adding an offset value corresponding to each EIT (exception/interrupt/trap) cause to the TBR value.

TBR (Table Base Register) holds the top address of EIT vector table. Default value (Initial value upon reset 000FFC00H) is used in “■ Interrupt causes, interrupt vectors and interrupt control register allocations.”

MB91103 Series

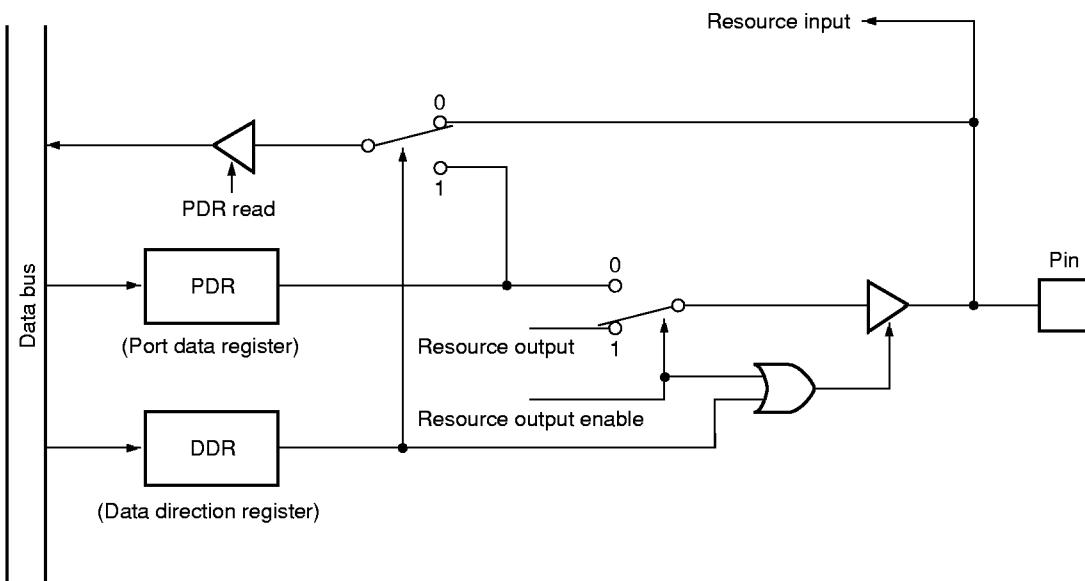

■ PERIPHERAL RESOURCES

1. I/O Ports

There are 2 types of I/O port register structure — port data register (PDR0 to PDR1) and data direction register (DDR0 to DDRI, AIC), where bits PDR0 to PDR1 and bits DDR0 to DDRI corresponds respectively. Each bit on the register corresponds to an external pin. In port registers input/output register of the port configures input/output function of the port, while corresponding bit (pin) configures input/output function in data direction registers. Bit "0" specifies input and "1" specifies output.

- For input (DDR = "0") setting;
PDR reading operation: reads level of corresponding external pin
PDR writing operation: writes set value to PDR
- For output (DDR = "1") setting;
PDR reading operation: reads PDR value
PDR writing operation: outputs PDR value to corresponding external pin

- **Block diagram**

• Port data register

Address	bit 7	bit 0	Initial value

2. DMA Controller (DMAC)

The DMA controller is a module embedded in FR 20 series devices, and performs DMA (Direct Memory Access) transfer.

DMA transfer performed by the DMA controller transfers data without intervention of CPU, contributing to enhanced performance of the system.

4. I/O Extended Serial Interface

This block is a serial interface of 8-bit × 1 structure enabling clock synchronous data transfer. Data transfer format of LSB first or MSB first can be selected.

DMA transfer operation is enabled by interrupt request.

There are two serial I/O operating modes.

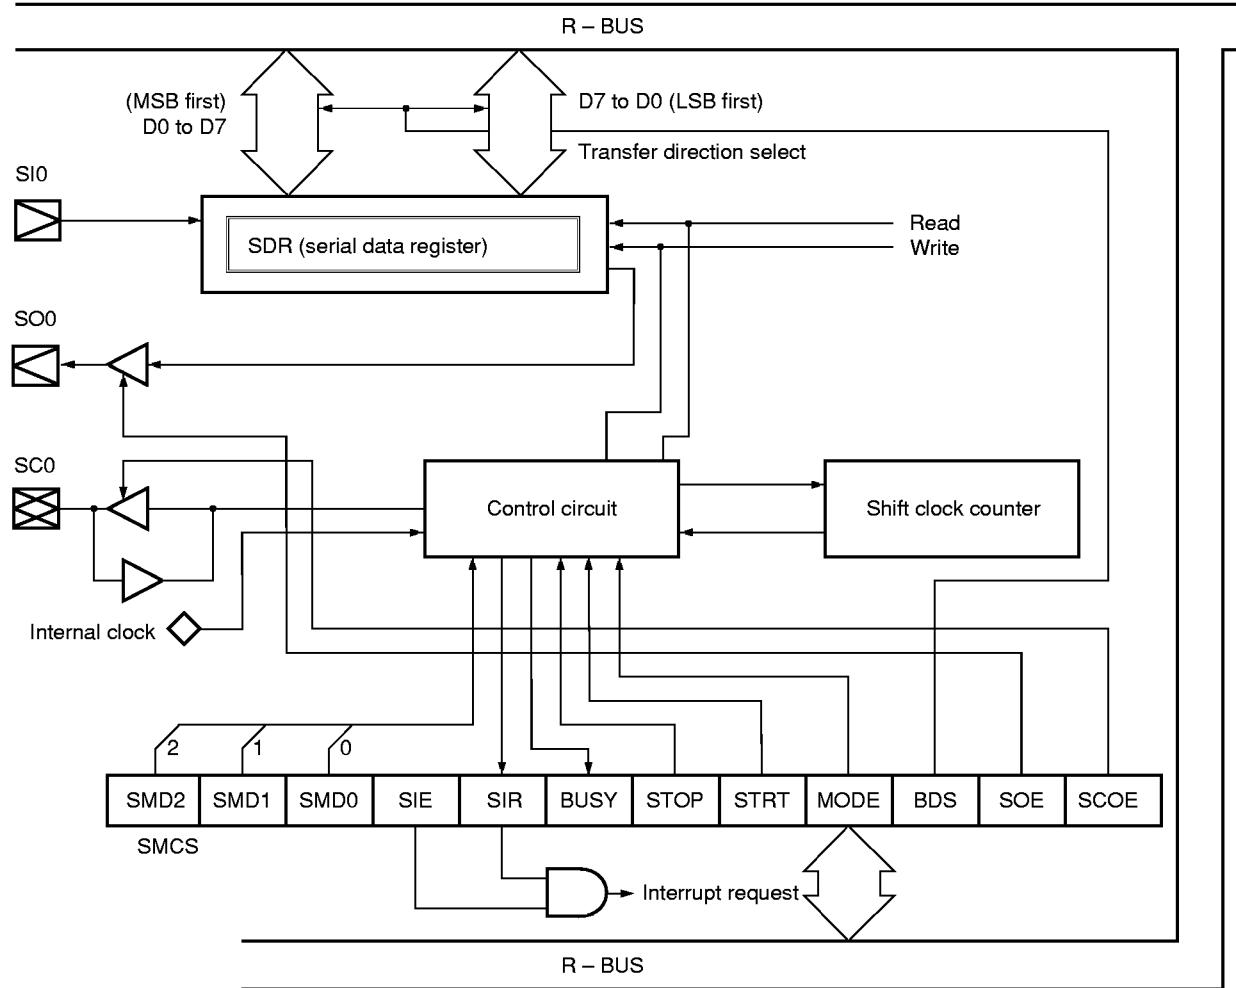

Internal shift clock mode : In this mode, data transfer operation is synchronized with internal clock.

It can be selected from 10/20/80/160/320 frequency division of machine clock.

External shift clock mode : In this mode, data transfer operation is synchronized with clock input from external pin (SC0). Data transfer by CPU instructions is enabled when the general port sharing the external pin (SC0) is so configured.

5. U-TIMER (16-bit timer for UART baud rate generation)

The U-TIMER is a 16-bit timer for generating UART baud rate. Combination of chip operating frequency and reload value of U-TIMER allows flexible setting of baud rate.

The U-TIMER operates as an interval timer by using interrupt issued on counter underflow.

The MB91103 has 2 channel U-TIMER embedded on the chip. By combining 2 interval timers in cascade, an interval of up to $2^{32} \times \phi$ can be counted.

MB91103 Series

6. 16-bit Reload Timer

The 16-bit timer consists of a 16-bit down counter, a 16-bit reload timer, a pre-scaler for generating internal count clock and control registers.

Internal clock can be selected from 3 types of internal clocks (divided by 2/8/32 of machine clock) or external clock.

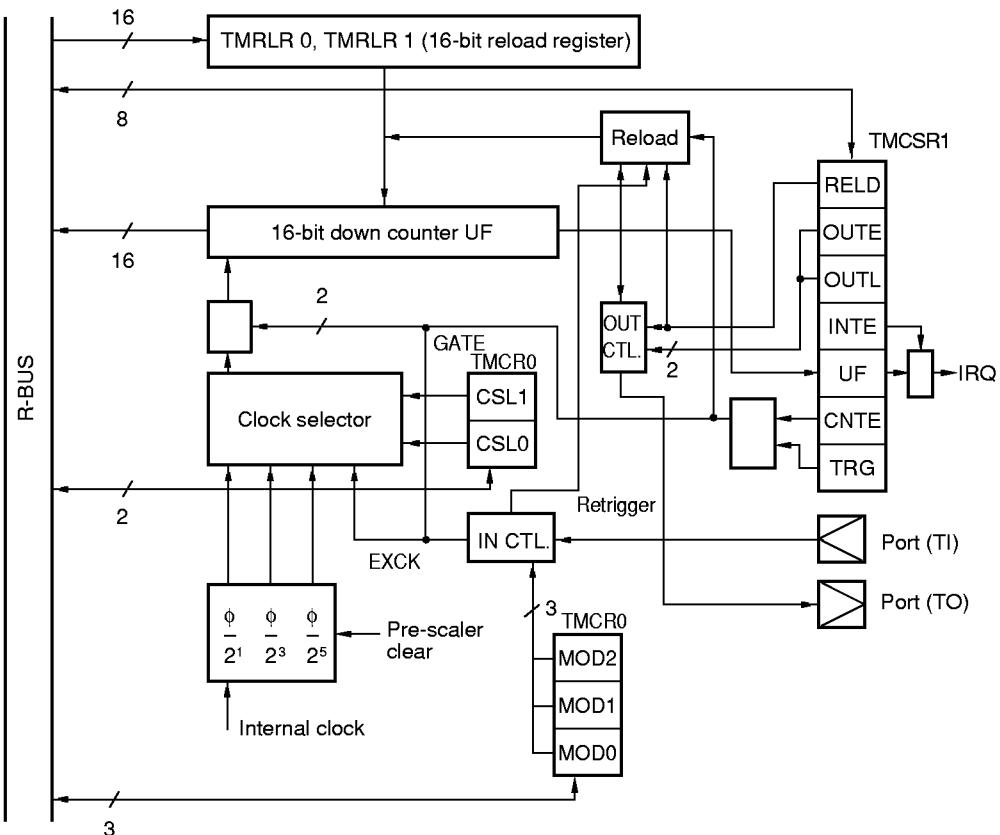

The input/output pin (TO) outputs a deleted toggle wave on every underflow in the reload mode and outputs a square wave indicating the timer is in counting operation in the one-shot mode.

The input pin (TI) is configured as an event input in the event count mode, a trigger input in the internal clock mode and also operates as a gate input.

The external event count function in the reload mode can operate as a external clock divider.

The MB91103 consists of 2 channels of 16-bit reload timer.

7. Real Time Input/Output Timer

The 16-bit input/output timer consists of a 16-bit free-run timer, 8 output compares and 4 input capture modules.

By using these functions, 8 independent wave outputs based on the 16-bit free-run timer as well as input pulse width measurement and external clock cycle measurement can be realized.

MB91103 Series

- Block diagram

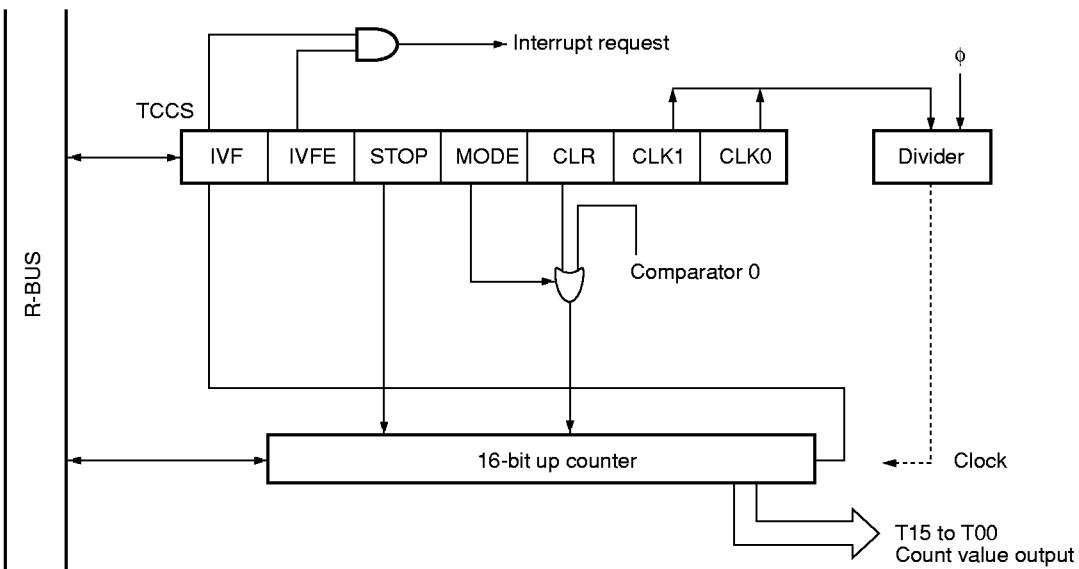

(1) 16-bit Free-Run Timer

The 16-bit free-run timer consists of a 16-bit up/down counter and a control status register.

Count value of this timer is used in output compare and input capture blocks as a basic time.

- Count clock can be selected from 4 types of frequencies ($\phi/4$, $\phi/16$, $\phi/32$, $\phi/64$).
- Interrupt can be issued upon count overflow.
- Selecting a mode and setting the count value as equaling to the value of compare register “0” initializes the counter.

MB91103 Series

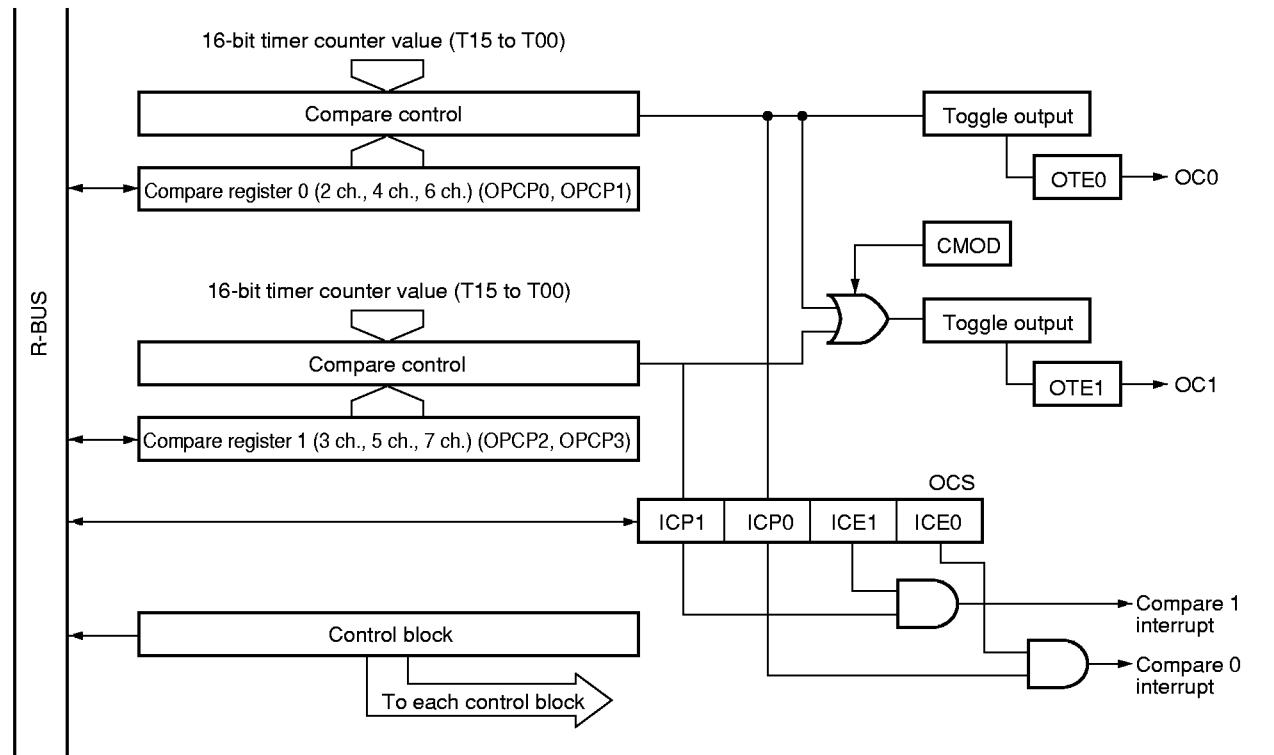

(2) Output Compare

The output compare consists of a 16-bit compare register, compare output pin block and a control register.

When the value set in the compare register matches with the 16-bit free-run timer value, output level is reversed, enabling an interrupt request to be issued.

- 8 compare registers can operate independently. A pair of compare registers can be used for controlling output pin levels.
- Initial output level of output pins can be specified.
- An interrupt is issued when compare value matches with timer value.

• Block diagram

MB91103 Series

(3) Input Capture

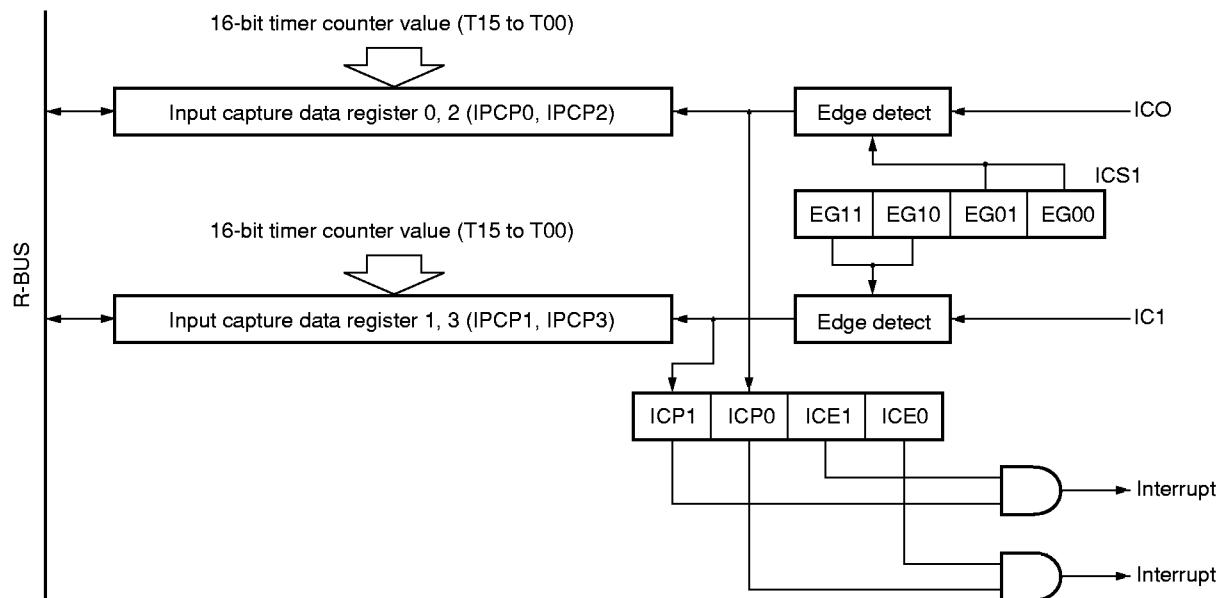

The input capture consists of input capture data registers and input capture control status registers.

The input capture detects a rising edge, a falling edge or both edges of external input signal and hold the 16-bit free-run timer value at the moment into the register. The input capture can issue an interrupt upon edge detection, if enabled.

Every input capture has a corresponding output pin.

- Effective edge of external input can be selected from rising, falling or both edges.
- The input capture issues an interrupt upon detection of an effective edge, if enabled.

"H" level maximum output current *3	I_{OH}	—	-10	mA	
"H" level average output current *4	I_{OHAV}	—	-4	mA	
"H" level maximum total output current	ΣI_{OH}	—	-50	mA	
"H" level average total output current *5	ΣI_{OHAV}	—	-20	mA	
Power dissipation	P_D	—	990	mW	
Operating temperature	T_A	-10	+70	°C	
Storage temperature	T_{STG}	-55	+150	°C	

*1: Make sure that the voltage does not exceed $V_{CC} + 0.3 \text{ V}$.

Make sure AV_{CC} does not exceed V_{CC} when turning on the device.

*2: V_I and V_O must not exceed $V_{CC} + 0.3 \text{ V}$.

*3: Maximum output current is a peak current value measured at a corresponding pin.

*4: Average output current is an average current for a 100 ms period at a corresponding pin.

*5: Average total output current is an average current for a 100 ms period for all corresponding pins.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

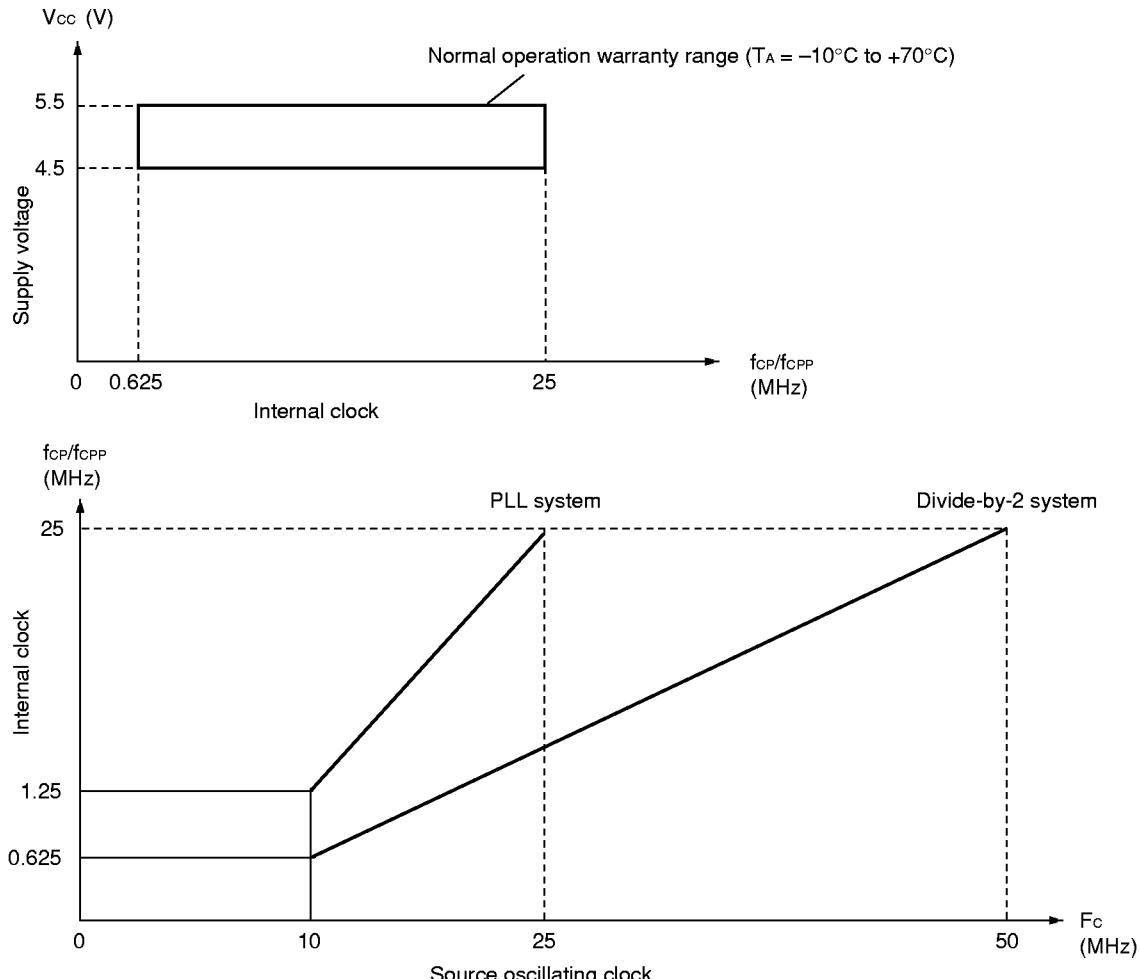

MB91103 Series

2. Recommended Operating Conditions

($V_{SS} = 0.0 \text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	4.5	5.5	V	Normal operation
		3.0	5.5	V	Retaining the RAM state in stop mode
Analog supply voltage	AV_{CC}	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
Analog reference voltage	AVRH	AVRL	AV_{CC}	V	
	AVRL	AVss	AVRH	V	
Operating temperature	T_A	-10	+70	°C	

MB91103 Series

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

3. DC Characteristics

($V_{CC} = +5.0\text{ V}\pm10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks

MB91103 Series

4. AC Characteristics

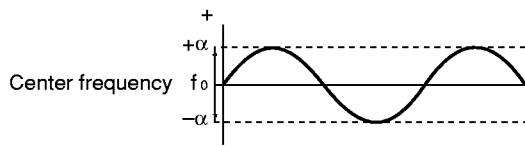

(1) Clock Timing Rating

($V_{CC} = +5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Clock frequency	f_C	X0 X1	—	10	50	MHz	
Clock cycle time	t_C	X0 X1		20	100	ns	
Frequency shift ratio (when locked) *1	Δf	—		—	5	%	
Input clock pulse width	P_{WH} P_{WL}	X0		8.5	—	ns	
Input clock rising/falling time	t_{CR} t_{CF}	X0		—	8	ns	$t_{CR} + t_{CF}$
Internal operating clock frequency	f_{CP}	—		0.625 *2	25	MHz	CPU system
	f_{CPP}	—		0.625 *2	25	MHz	Peripheral system
Internal operating clock cycle time	t_{CP}	—		40	1600 *2	ns	CPU system
	t_{CPP}	—		40	1600 *2	ns	Peripheral system

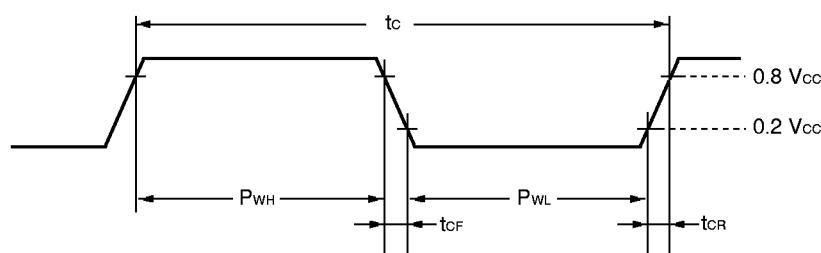

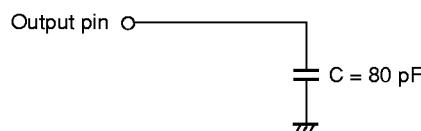

*1: Frequency shift ratio stands for deviation ratio of the operating clock from the center frequency in the clock multiplication system.

$$\Delta f = \frac{|\alpha|}{f_0} \times 100 (\%)$$

*2: These values are for a minimum clock of 10 MHz input to X0, a divide-by-2 system of the source oscillation and a 1/8 gear.

• AC rating measurement conditions

(2) Clock Output Timing

($V_{CC} = +5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Cycle time	t_{CYC}	CLK	—	t_{CP}	—	ns	*1
$\text{CLK} \uparrow \rightarrow \text{CLK} \downarrow$	t_{CHCL}	CLK		$1/2 \times t_{CYC} - 10$	$1/2 \times t_{CYC} + 10$	ns	*2
$\text{CLK} \downarrow \rightarrow \text{CLK} \uparrow$	t_{CLCH}	CLK		$1/2 \times t_{CYC} - 10$	$1/2 \times t_{CYC} + 10$	ns	*3

*1: t_{CYC} is a frequency for 1 clock cycle including a gear cycle.

*2: This rating is for a gear cycle of $\times 1$.

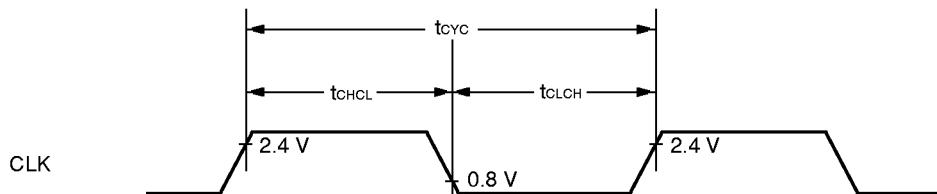

When a gear cycle of $1/2$, $1/4$, $1/8$ is selected, substitute n of the following equations with $1/2$, $1/4$, $1/8$, respectively.

- Min. : $(1 - n/2) \times t_{CYC} - 10$
- Max. : $(1 - n/2) \times t_{CYC} + 10$

*3: This rating is for a gear cycle of $\times 1$.

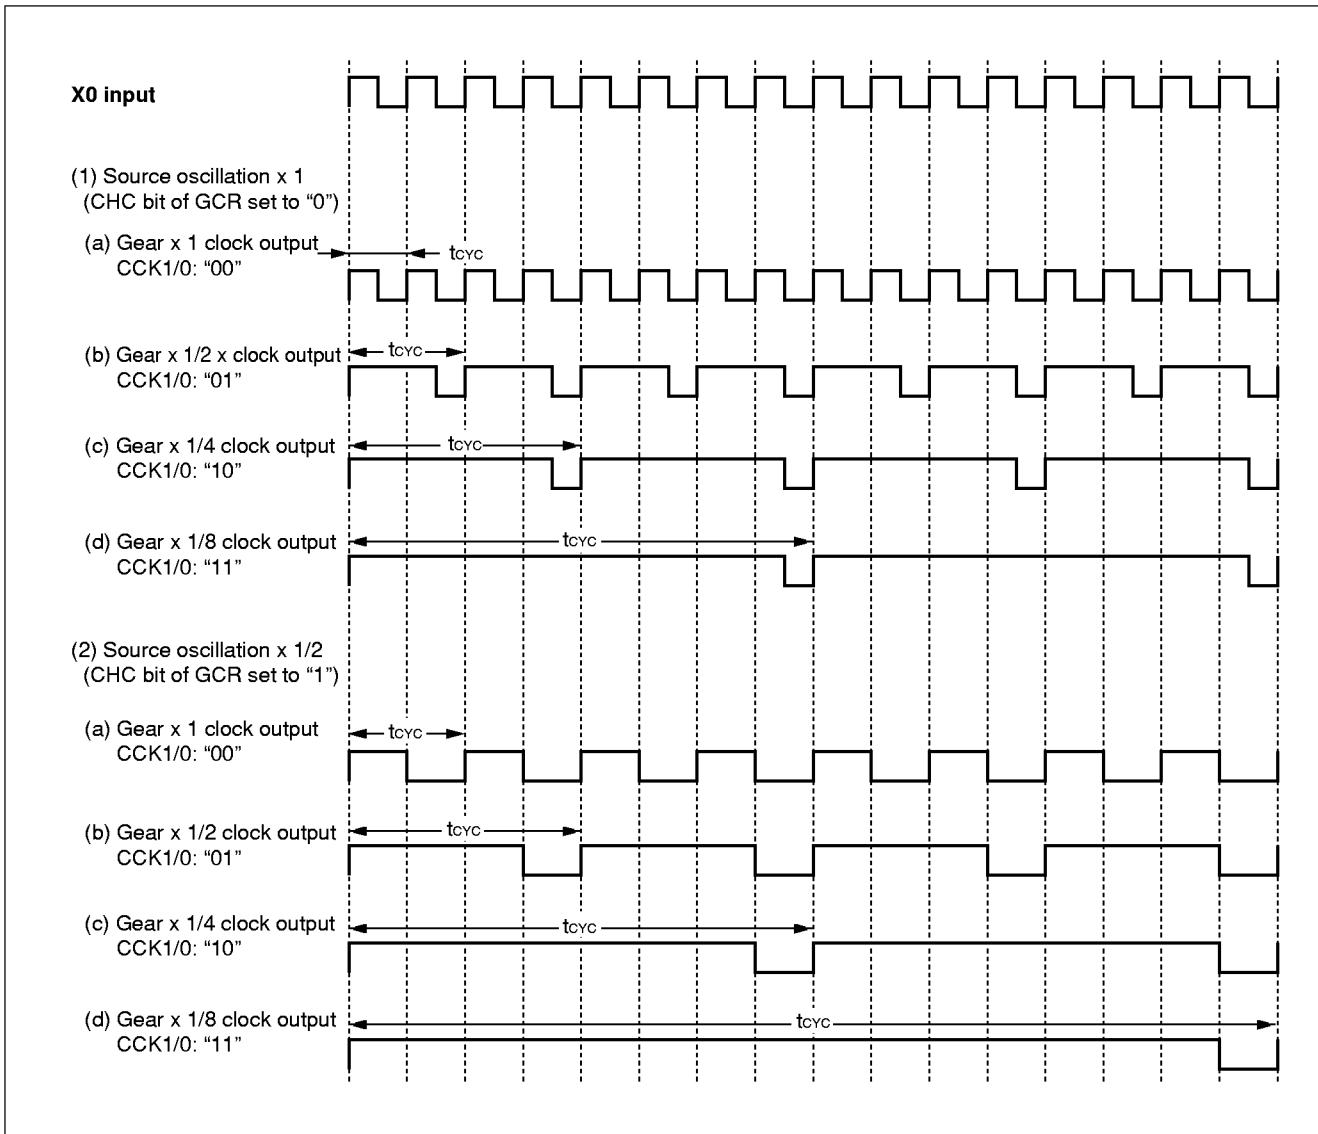

When a gear cycle of $1/2$, $1/4$, $1/8$ is selected, substitute n of the following equations with $1/2$, $1/4$, $1/8$, respectively.

- Min. : $n/2 \times t_{CYC} - 10$
- Max. : $n/2 \times t_{CYC} + 10$

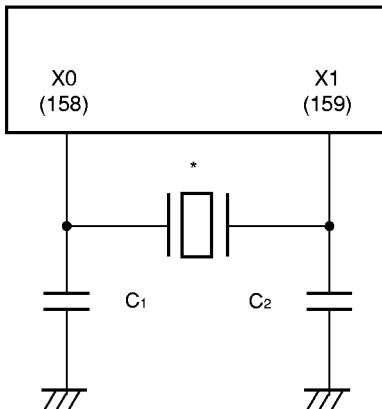

MB91103 Series

The relation between X0 input and clock output for configured by CHC/CCK1/CCK0 settings of GCR (Gear control register) is as follows:

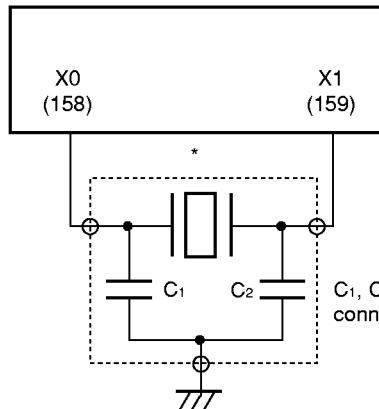

- Ceramic oscillator applications

Recommended circuit (2 contacts)

Recommended circuit (3 contacts)

(): C₁ and C₂ internally connected.

(3) Reset Input

(V_{CC} = +5.0 V±10%, V_{SS} = 0.0 V, T_A = -10°C to +70°C)

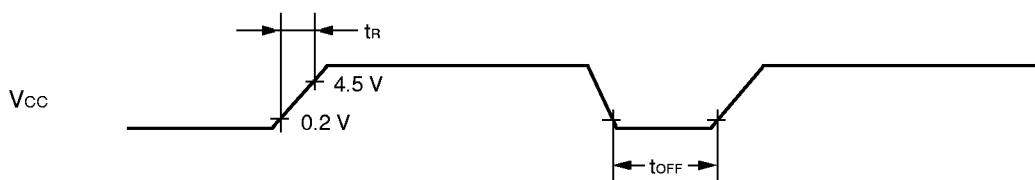

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Reset input time	t _{RSTL}	RST	—	t _{CP} × 5	—	ns	

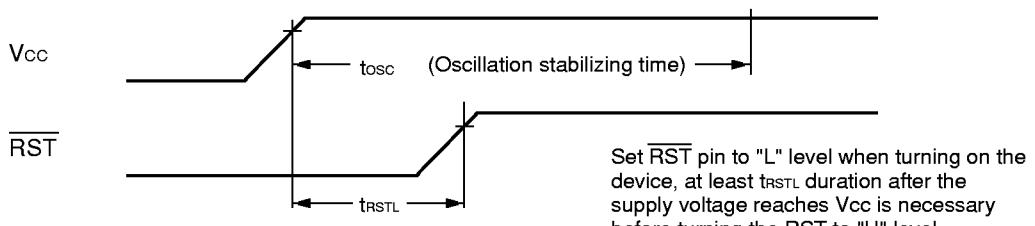

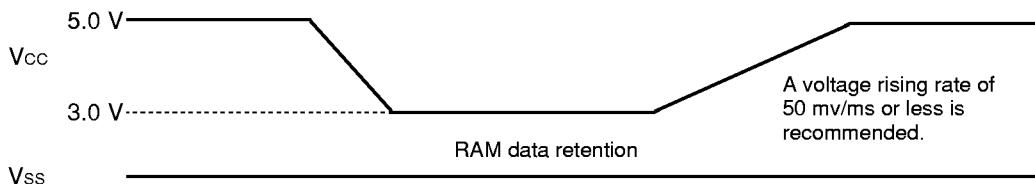

(4) Power-on Reset

($V_{CC} = +5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power supply rising time	t_R	V_{CC}	—	—	30	ms	$V_{CC} < 0.2\text{ V}$ before turning power supply
Power supply shut off time	t_{OFF}	V_{CC}		1	—	ms	For repeated operations
Oscillation stabilizing time	t_{osc}	—		$2 \times t_c \times 2^{21}$	—	ns	

Sudden change in supply voltage during operation may initiate a power-on sequence.
To change supply voltage during operation, it is recommended to smoothly raise the voltage to avoid rapid fluctuations in the supply voltage.

t_{RSTL} : Reset input time

MB91103 Series

(5) Normal Bus Access Read/write Operation

($V_{CC} = +5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

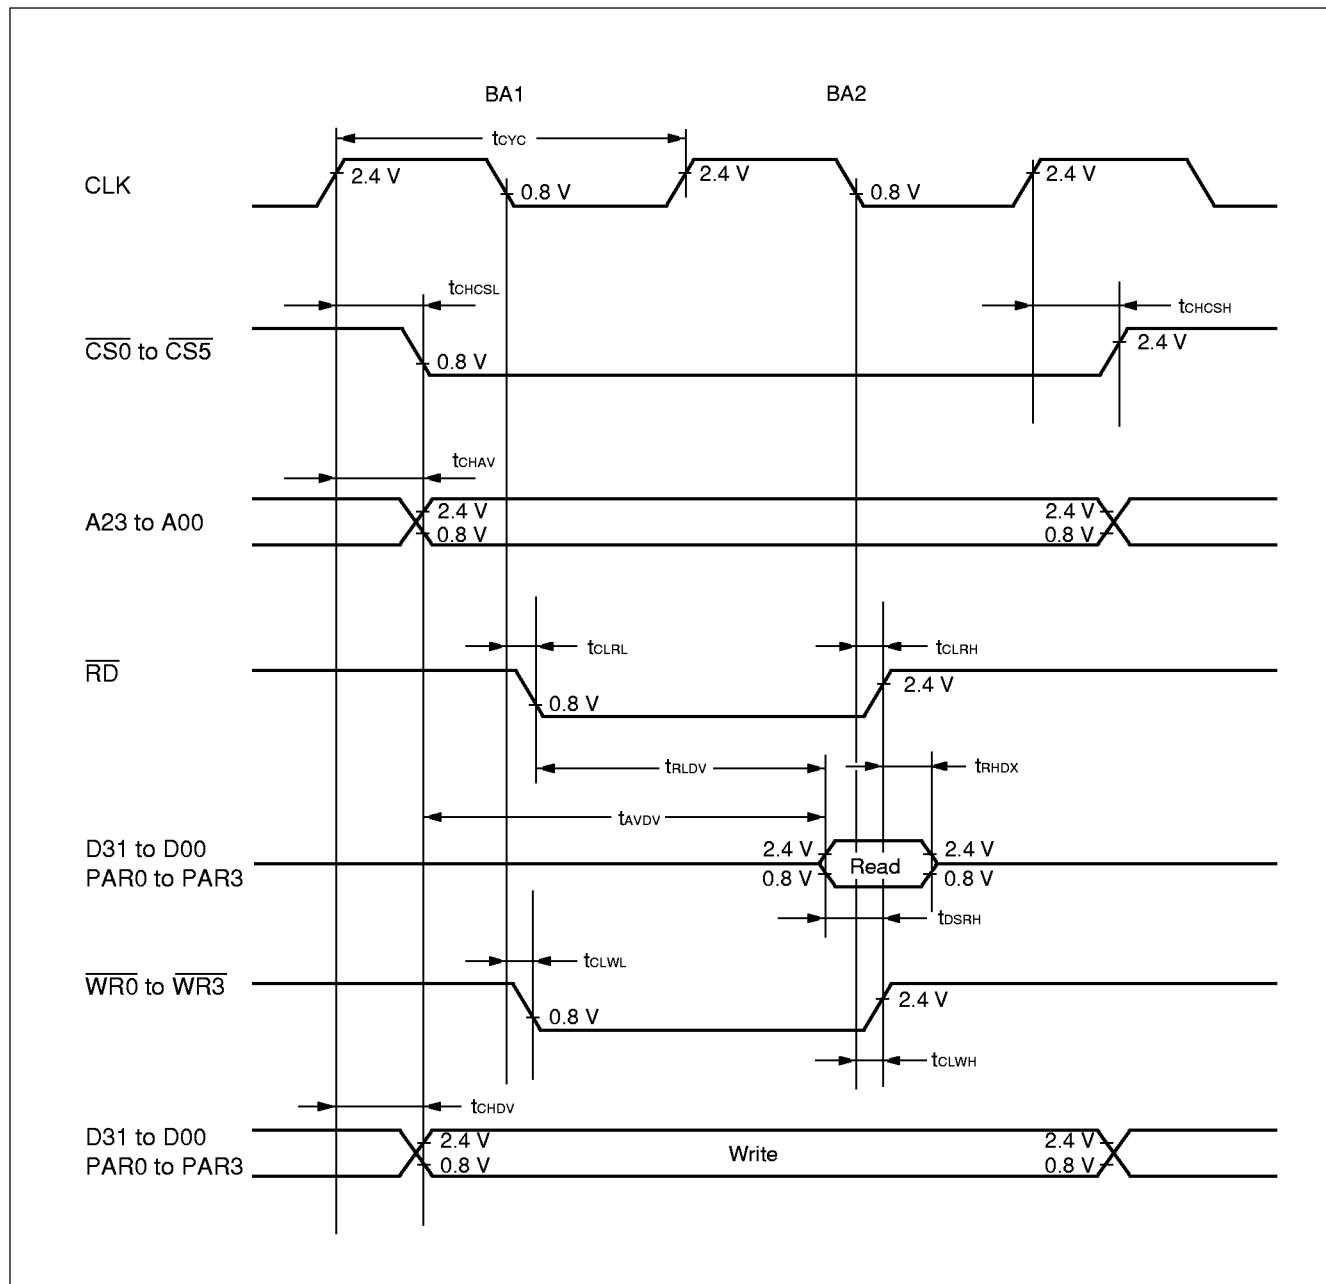

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
CS0 to CS5 delay time	t_{CHCSL}	CLK	—	—	15	ns	
	t_{CHCSH}	CS0 to CS5		—	15	ns	
Address delay time	t_{CHAV}	CLK A23 to A00	—	—	15	ns	
Data (parity) delay time	t_{CHDV}	CLK D31 to D00 PAR0 to PAR3		—	15	ns	
\overline{RD} delay time	t_{CLRL}	CLK	—	—	6	ns

$\overline{RD} \uparrow \rightarrow$ data hold time	t_{RHDX}			0	—	ns	

* : When bus timing is delayed by automatic wait insertion or RDY input, add ($t_{CYC} \times$ extended cycle number for delay) to this rating.

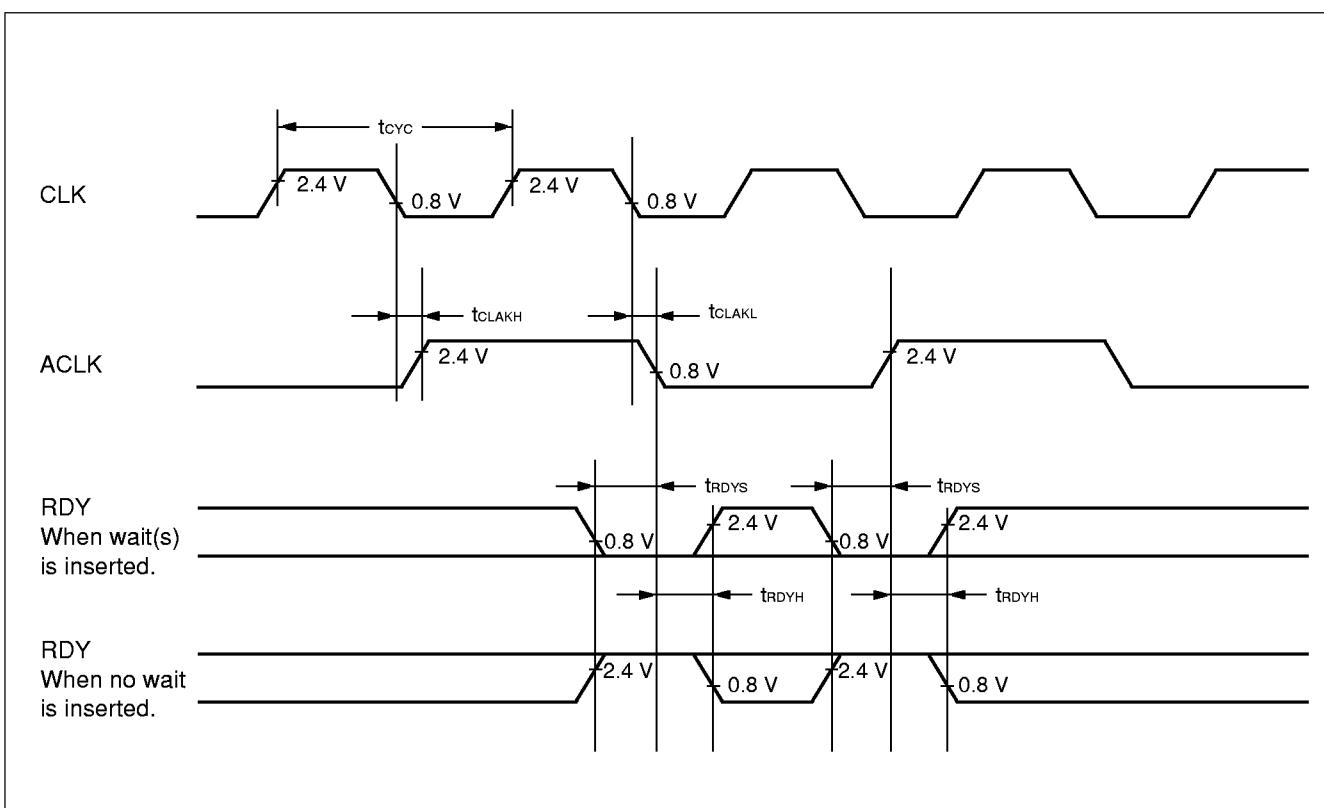

MB91103 Series

(7) Ready Input Timing

($V_{CC} = +5.0 \text{ V} \pm 10\%$, $V_{SS} = 0.0 \text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
ACLK delay time	t_{CLAKH}	CLK	—	—	6	ns	
	t_{CLAKL}	ACLK		—	6	ns	
RDY set up time → ACLK ↑↓	t_{RDYS}	RDY	—	10	—	ns	
		ACLK		0	—	ns	
ACLK ↑↓→ RDY hold time	t_{RDYH}	ACLK					
		RDY					

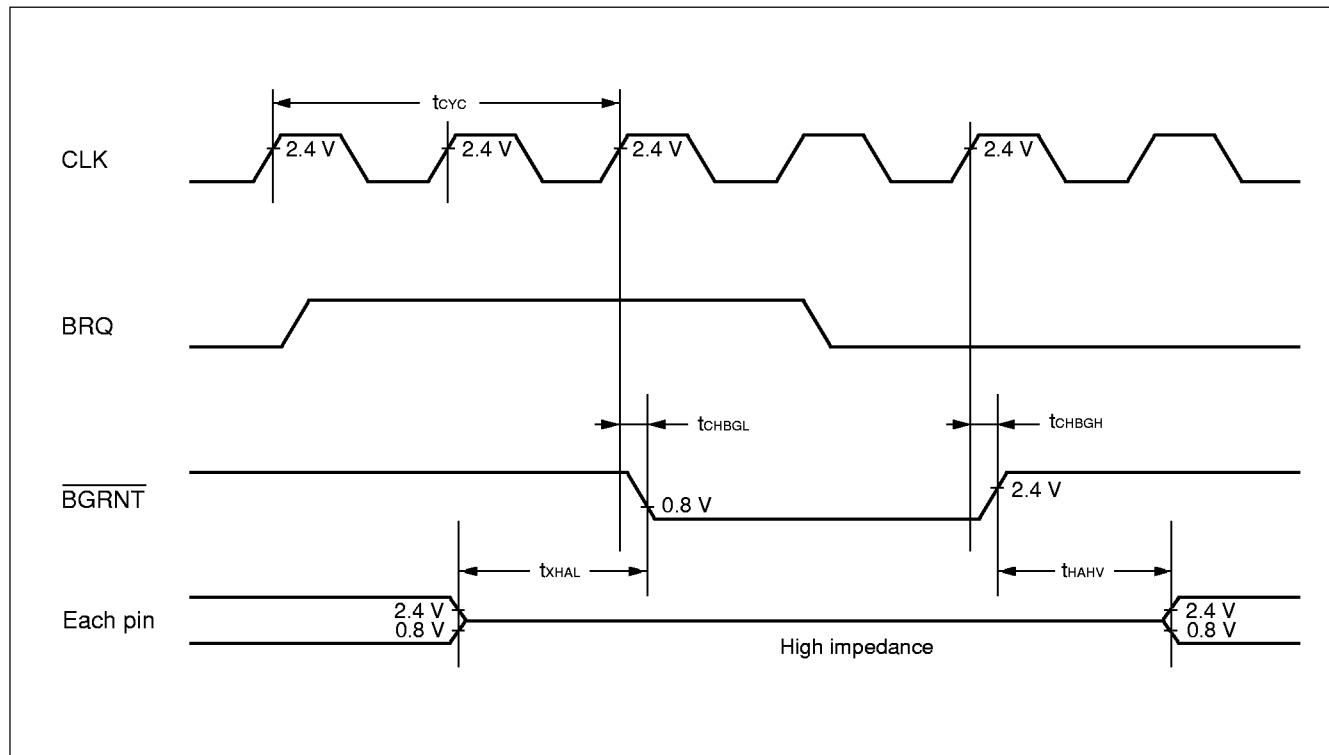

(8) Hold Timing

($V_{CC} = +5.0 \text{ V} \pm 10\%$, $V_{SS} = 0.0 \text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
$\overline{\text{BGRNT}}$ delay time	t_{CHBGL}	CLK	—	—	6	ns	
	t_{CHBGH}	$\overline{\text{BGRNT}}$		—	6	ns	
Pin floating $\rightarrow \overline{\text{BGRNT}} \downarrow$ time	t_{XHAL}	$\overline{\text{BGRNT}}$	—	$t_{CYC} - 10$	$t_{CYC} + 10$	ns	
	t_{HAHV}			$t_{CYC} - 10$	$t_{CYC} + 10$	ns	

Note: There is a delay time of more than 1 cycle from BRQ input to $\overline{\text{BGRNT}}$ change.

MB91103 Series

(9) Normal DRAM Mode Read/Write Cycle

($V_{CC} = +5.0 \text{ V} \pm 10\%$, $V_{SS} = 0.0 \text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH}	CLK RAS		—	6	ns	
	t_{CHRAL}			—	6	ns	
CAS delay time	t_{CLCDSL}	CLK CAS		—	6	ns	
	t_{CLCASH}			—	6	ns	
ROW address delay time	t_{CHRAV}	CLK A23 to A00		—	15	ns	
COLUMN address delay time	t_{CHCAV}			—	15	ns	
DW delay time	t_{CHDWL}	CLK DW		—	15	ns	
	t_{CHDWH}			—	15	ns	
Output data (parity) delay time	t_{CHDV1}	CLK D31 to D00 PAR0 to PAR3		—	15	ns	
RAS \downarrow valid data (parity) input time	t_{RLDV}	RAS D31 to D00 PAR0 to PAR3		—	$5/2 \times t_{CYC} - 16$	ns	*1 *2
CAS \downarrow valid data (parity) input time	t_{CLDV}	CAS D31 to D00 PAR0 to PAR3		—	$t_{CYC} - 10$	ns	*1
CAS \uparrow data (parity) hold time	t_{CADH}			0	—	ns	

CAS: CS0L to CS1H pins are for CAS signal outputs.

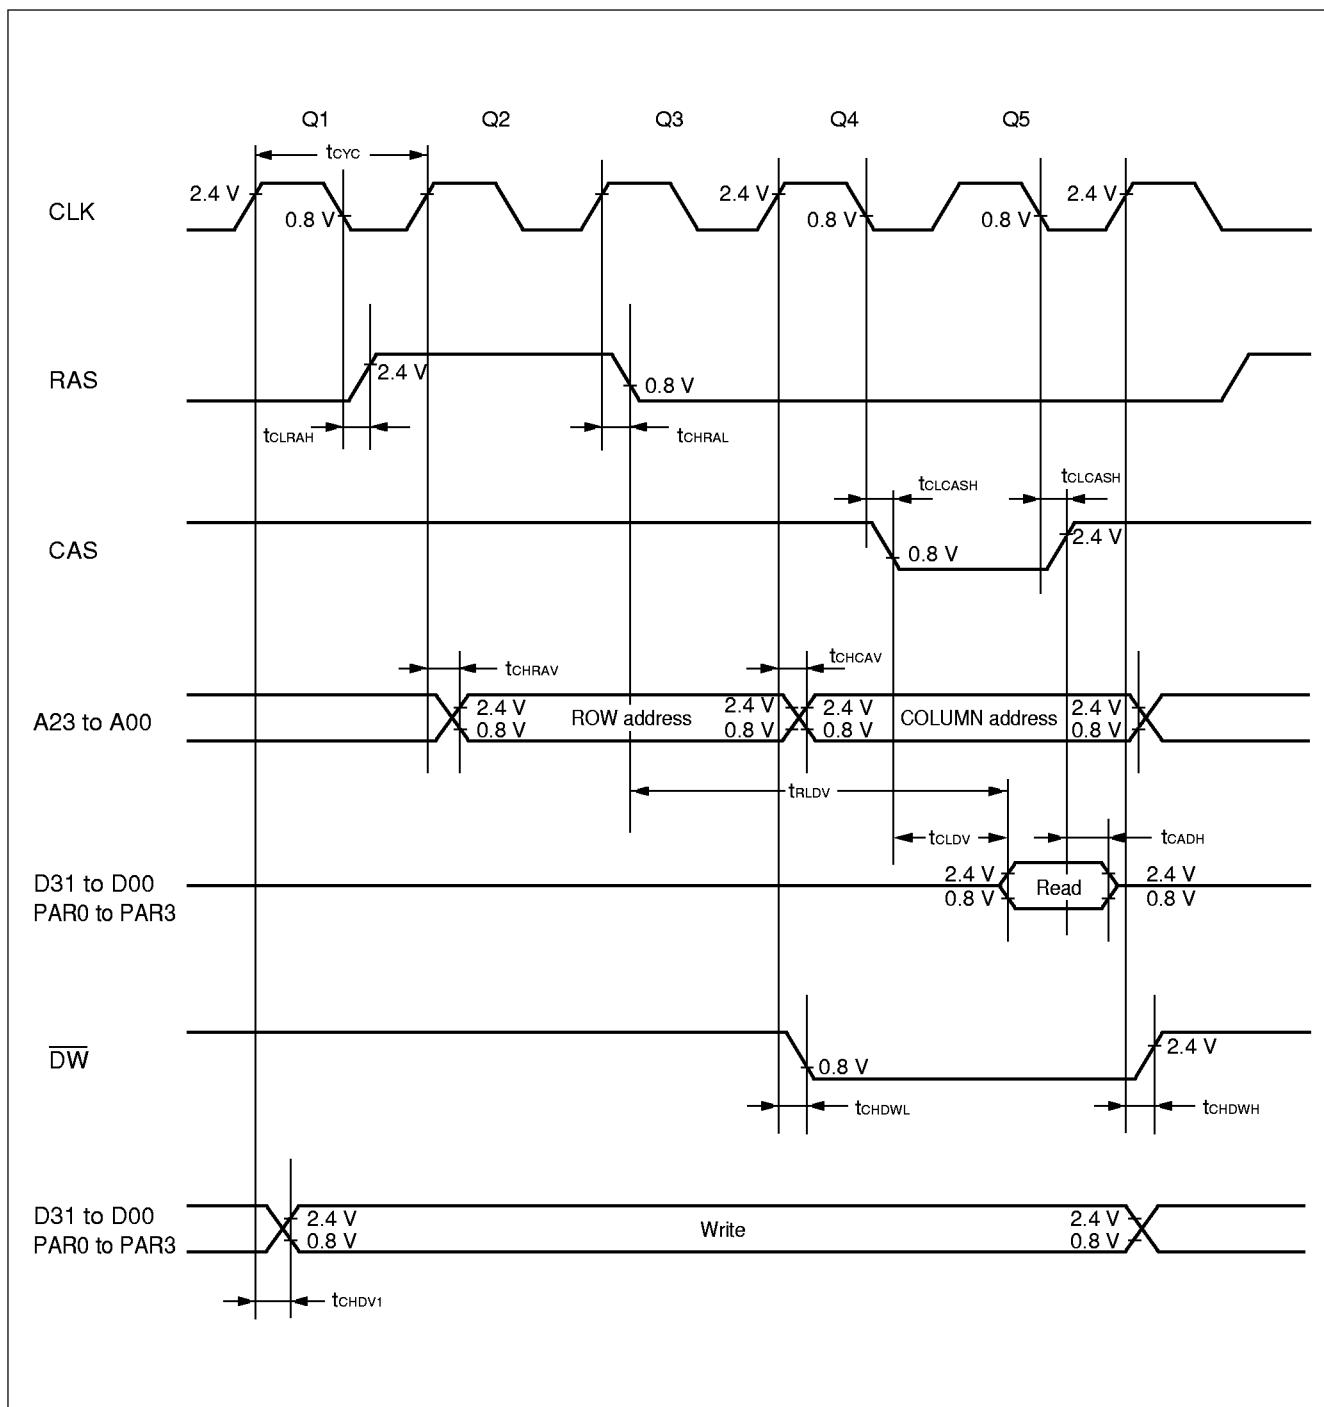

DW: DW0, DW1 and CS0H to CS1H are used for WE outputs.

*1: When Q1 cycle or Q4 cycle is extended for "1" cycle, add t_{CYC} time to this rating.

*2: This rating is for a gear cycle of $\times 1$.

When a gear cycle of 1/2, 1/4, 1/8 is selected, substitute "n" in the following equation with 1/2, 1/4, 1/8, respectively.

- Equation: $(3 - n/2) \times t_{CYC} - 16$

MB91103 Series

(10) Normal DRAM Mode Fast Page Read/Write Cycle

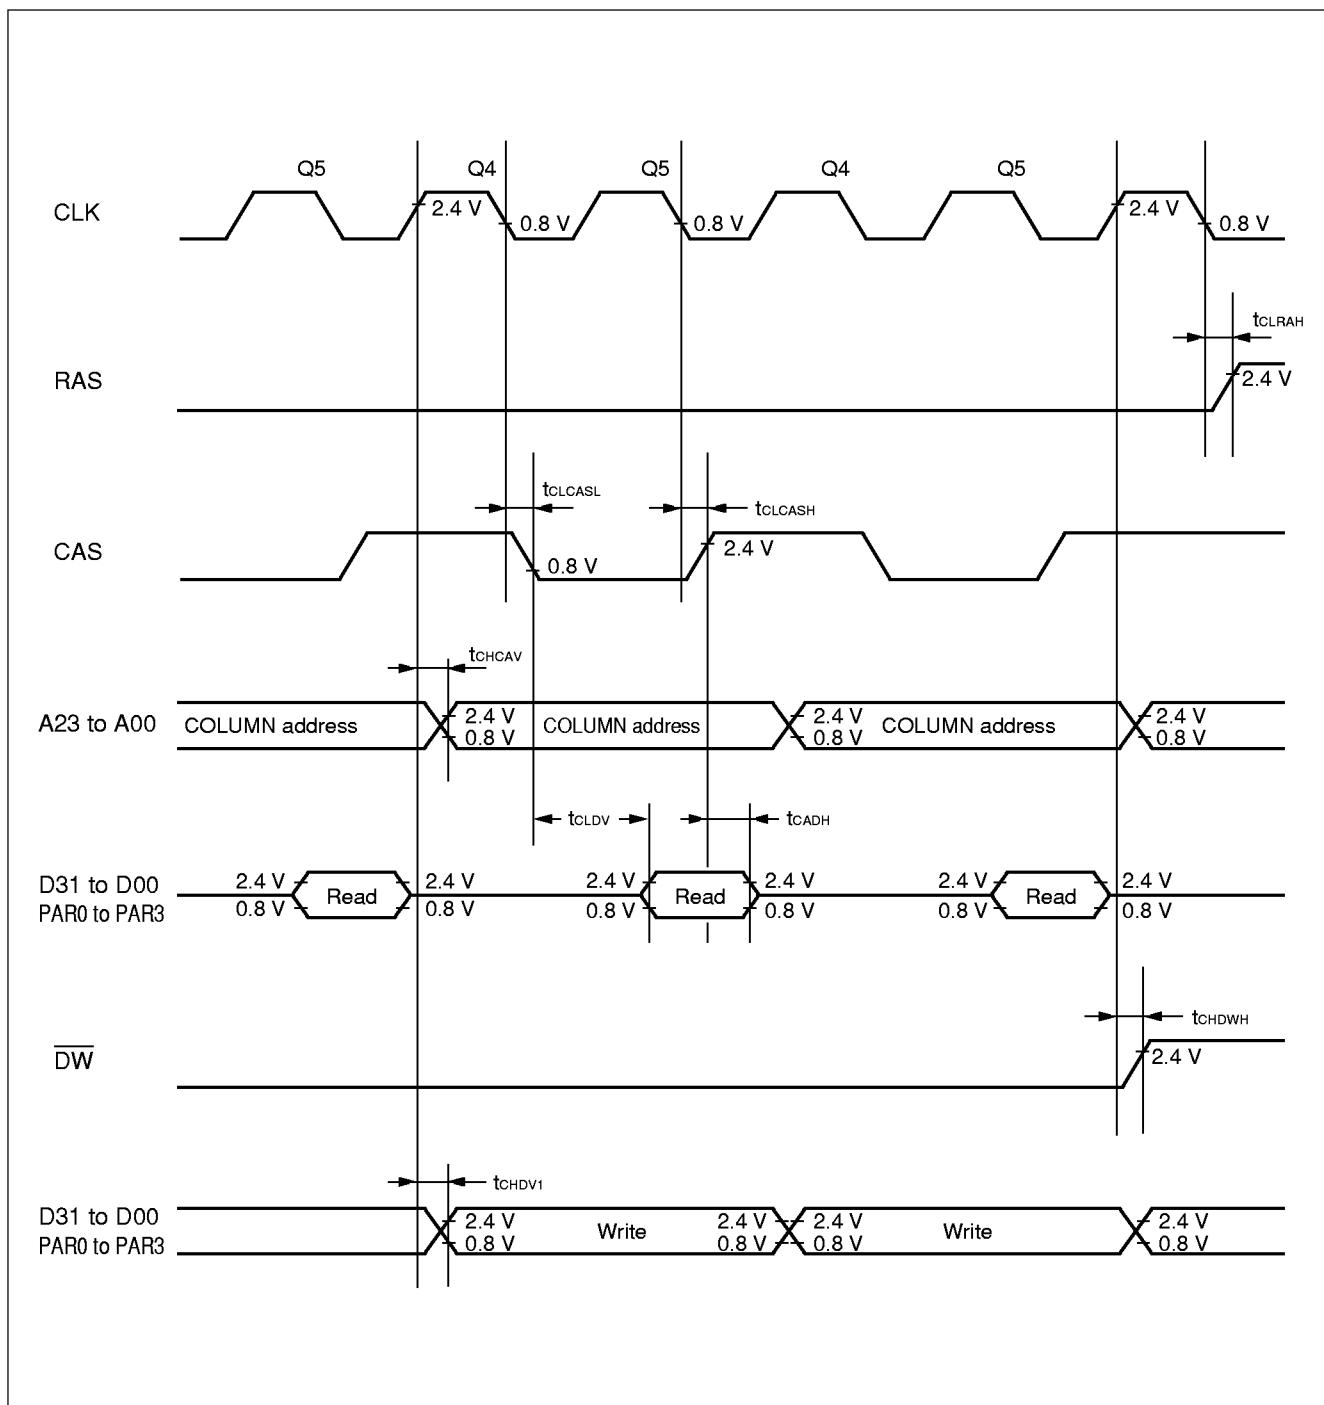

($V_{CC} = +5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH}	CLK, RAS	—	—	6	ns

5. A/D Conversion Block Electrical Characteristics

(AV_{CC} = V_{CC} = +4.5 V to +5.5 V, AV_{SS} = V_{SS} = 0.0 V, T_A = -10°C to +70°C, +4.5 V ≤ AVRH – AVRL)

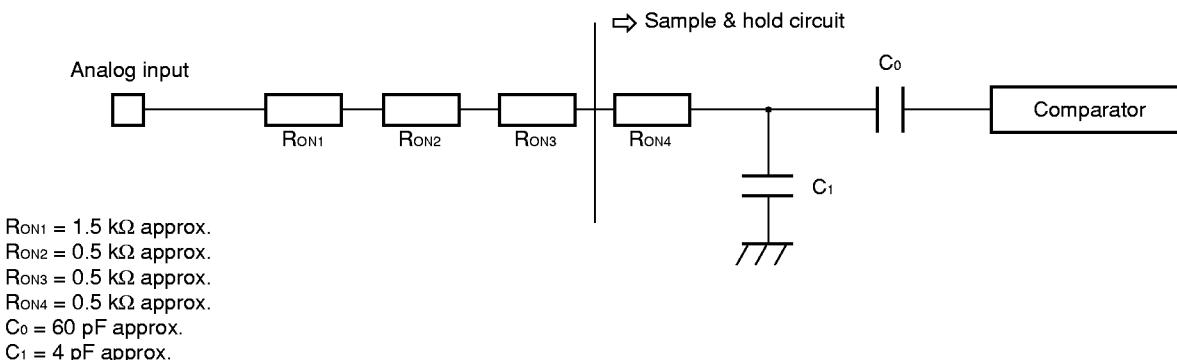

Parameter	Symbol	Pin name	Value			Unit
			Min.	Typ.	Max.	
Resolution	—	—	—	10	10	BIT
Total error	—	—	—	—	±3.0	LSB
Linearity error	—	—	—	—	±2.0	LSB
Differentiation linearity error	—	—	—	—	±1.5	LSB
Zero transition voltage	V _{OT}	AN0 to AN7	AVRL – 1.5	AVRL + 0.5	AVRL + 2.5	LSB
Full-scale transition voltage	V _{FST}	AN0 to AN7	AVRH – 4.5	AVRH – 1.5	AVRH + 0.5	LSB
Conversion time	—	—	5.6 *1	—	—	μs
Analog port input current	I _A _{IN}	AN0 to AN7	—	0.1	10	μA
Analog input voltage	V _A _{IN}	AN0 to AN7	AVRL	—	AVRH	V
Reference voltage	—	AVRH	AVRL	—	AV _{CC}	V
	—	AVRL	AV _{SS}	—	AVRH	V
Power supply current	I _A	AV _{CC}	—	4	—	mA
	I _{AH}		—	—	5 *2	μA
Reference voltage supply current	I _R	AVRH	—	200	—	μA
	I _{RH}		—	—	170 *2	μA
Conversion variance between channels	—	AN0 to AN7	—	—	4	LSB

*1: V_{CC} = 5.0 V ±10%, machine clock of 25 MHz

*2: Current value for A/D converters not in operation, CPU stop mode (V_{CC} = AV_{CC} = AVRH = 5.0 V)

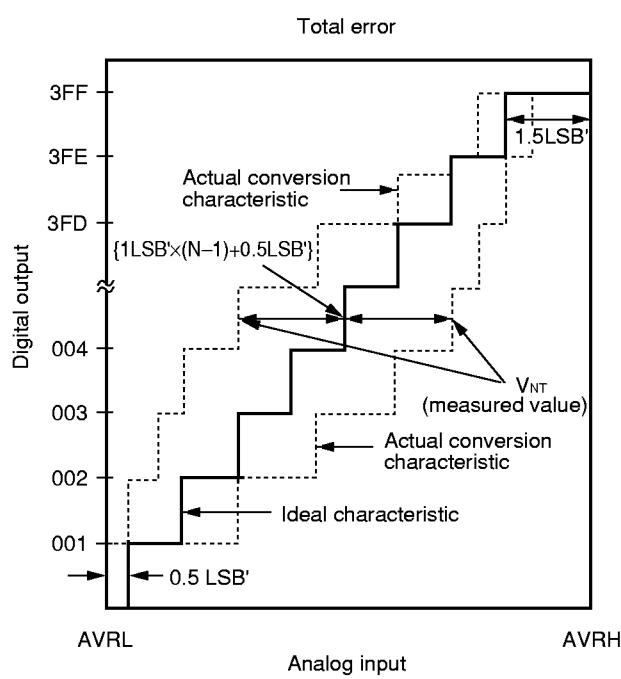

- Notes:
- As the absolute value of |AVRH-AVRL| decreases, relative error increases.
 - Output impedance of external circuit of analog input under following conditions;
Output impedance of external circuit < 7 kΩ approx.
If output impedance of external circuit is too high, analog voltage sampling time may be too short for accurate sampling (sampling time is 5.6 μs for a machine clock of 25 MHz).

• Analog input circuit model plan

6. Definitions of A/D Converter Descriptions

- Resolution
The smallest change in analog voltage detected by A/D converter.
- Linearity error
A deviation of actual conversion characteristic from a line connecting the zero-transition point (between "00 0000 0000" ↔ "00 0000 00001") to the full-scale transition point (between "11 1111 1110" ↔ "11 1111 1111").
- Differential linearity error
A deviation of a step voltage for changing the LSB of output code from ideal input voltage.
- Total error
A difference between actual value and theoretical value. The overall error includes zero-transition error, full-scale transition error and linearity error.

$$1 \text{ LSB}' (\text{Ideal value}) = \frac{\text{AVRH} - \text{AVRL}}{1024} [\text{V}]$$

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB}' \times (N-1) + 0.5 \text{ LSB}'\}}{1 \text{ LSB}'}$$

$$V_{0T}' (\text{Ideal value}) = \text{AVRL} + 0.5 \text{ LSB}' [\text{V}]$$

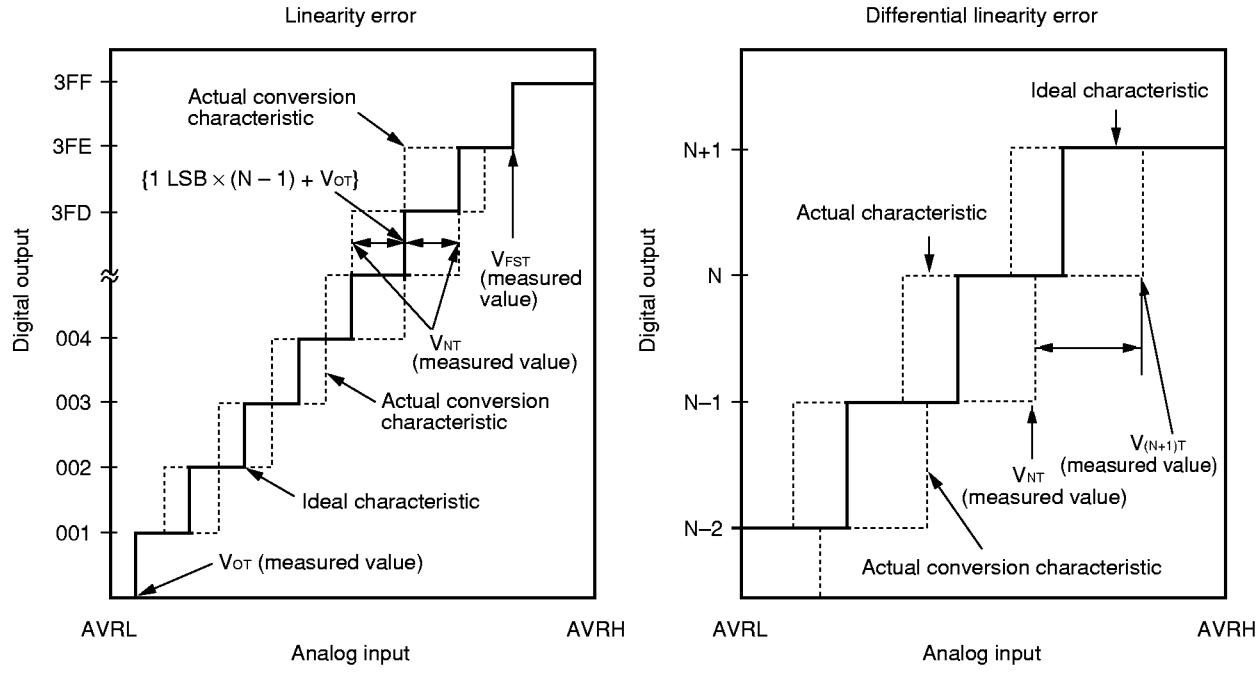

$$V_{FST}' (\text{Ideal value}) = \text{AVRL} + 1.5 \text{ LSB}' [\text{V}]$$

V_{NT} : A voltage for causing transition of digital output from $(N-1)$ to N

(Continued)

MB91103 Series

(Continued)

$$\text{Linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}}$$

$$[\text{LSB}]$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1$$

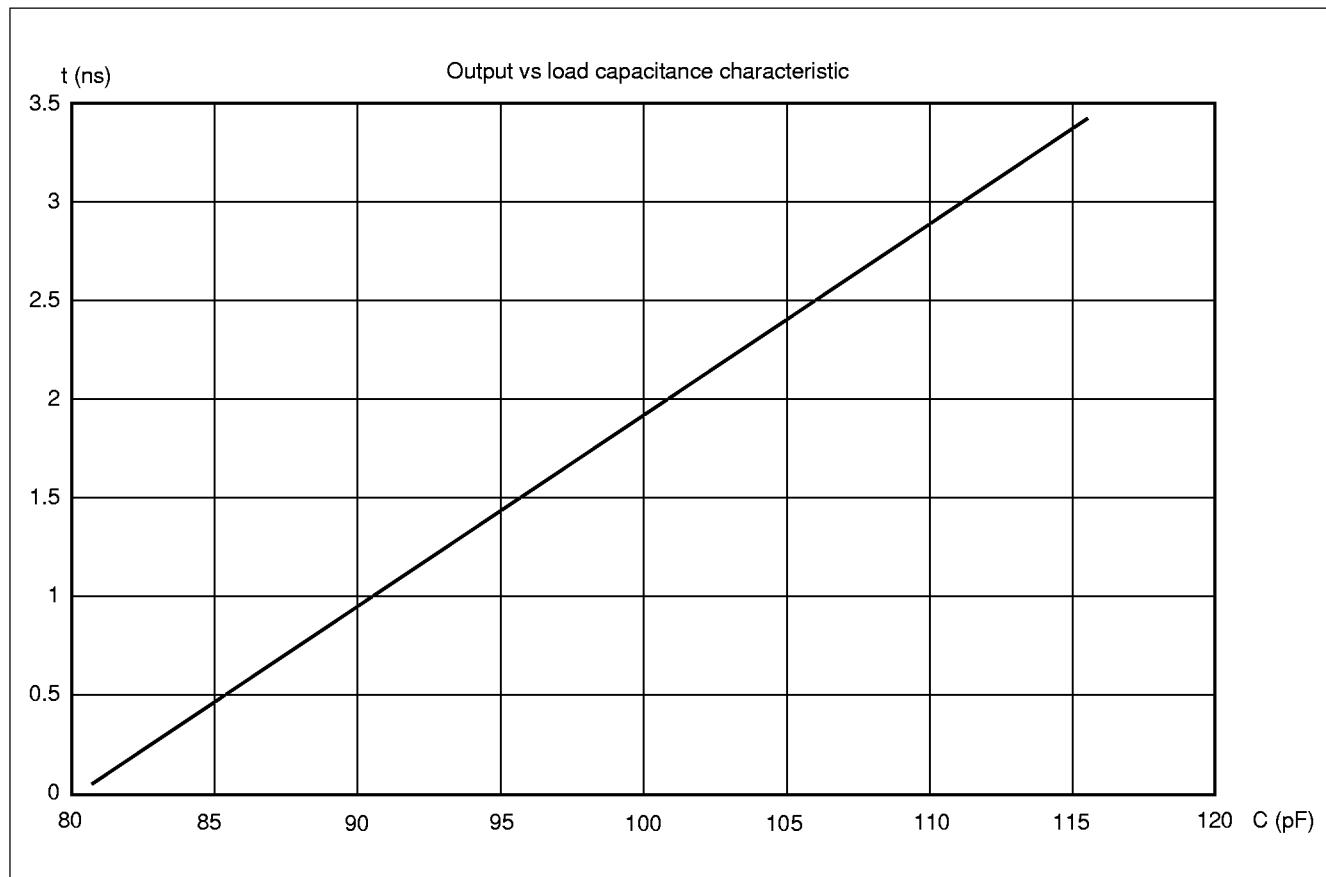

$$[\text{LSB}]$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} [\text{V}]$$

V_{OT}: A voltage for causing transition of digital output from (000)_H to (001)_H

V_{FST}: A voltage for causing transition of digital output from (3FE)_H to (3FF)_H

■ INSTRUCTIONS

1. How to Read Instruction Set Summary

Mnemonic	Type	OP	~	NZVC	Operation	Remarks
ADD Rj, Ri	A	A6	1	CCCC	Ri + Rj → Ri	
* ADD #s5, Ri	C	A4	1	CCCC	Ri + s5 → Ri	
,	,	,	,	,	,	
,	,	,	,	,	,	
↓ (1)	↓ (2)	↓ (3)	↓ (4)	↓ (5)	↓ (6)	↓ (7)

- (1) Names of instructions.

Instructions marked with * are not included in CPU specifications. These are extended instruction codes added/extended at assembly language levels.

- (2) Addressing modes specified as operands are listed in symbols.

Refer to "2. Addressing mode symbols" for further information.

- (3) Instruction types.

- (4) Hexa-decimal expressions of instructions.

- (5) Number of machine cycles needed for execution.

a: Memory access cycle. May be extended by Ready function.

b: b: Memory access cycle. May be extended by Ready function.

If an object register in a LD operation is referenced by an immediately following instruction, the interlock function is activated and number of cycles needed for execution increases.

c: If an immediately following instruction operates to an object of R15, SSP or USP in read/write mode or if the instruction belongs to instruction format A group, the interlock function is activated and number of cycles needed for execution increases by 1 to make the total number of 2 cycles needed.

d: If an immediately following instruction refers to MDH/MDL, the interlock function is activated and number of cycles needed for execution increases by 1 to make the total number of 2 cycles needed.

For a, b, c and d, minimum execution cycle is 1.

- (6) Change in flag sign.

- Flag meanings

N : Negative flag

Z : Zero flag

V : Over flag

C : Carry flag

- Flag change

C : Change

- : No change

0 : Clear

1 : Set

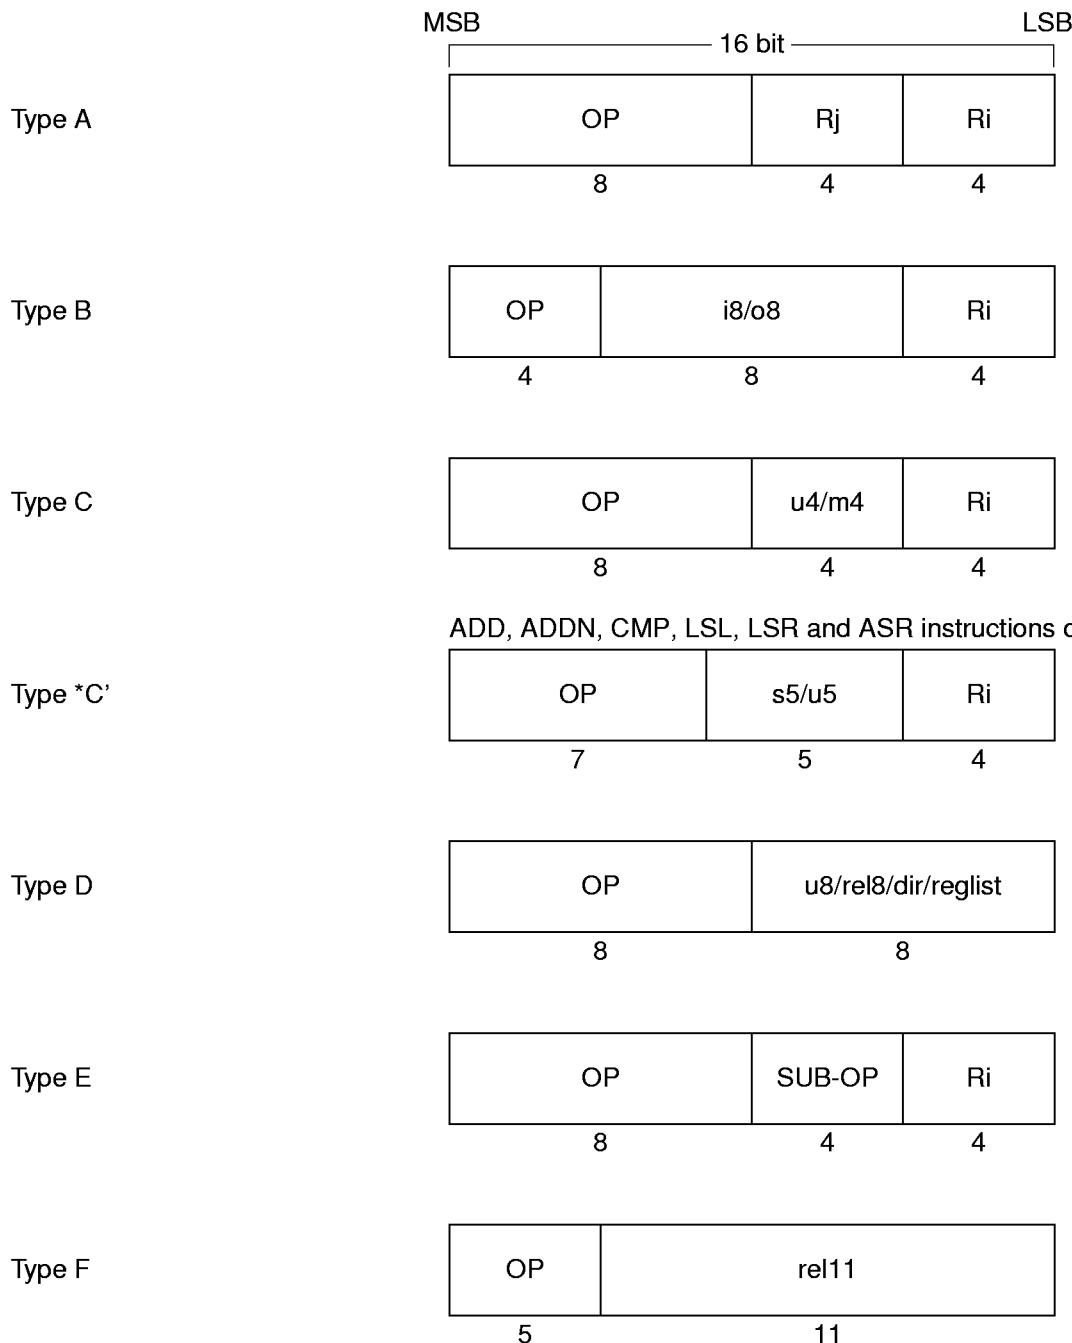

- (7) Operation carried out by instruction.

2. Addressing Mode Symbols

Ri	: Register direct (R0 to R15, AC, FP, SP)
Rj	: Register direct (R0 to R15, AC, FP, SP)
R13	: Register direct (R13, AC)
Ps	: Register direct (Program status register)
Rs	: Register direct (TBR, RP, SSP, USP, MDH, MDL)
CRi	: Register direct (CR0 to CR15)
CRj	: Register direct (CR0 to CR15)
#i8	: Unsigned 8-bit immediate (-128 to 255) Note: -128 to -1 are interpreted as 128 to 255
#i20	: Unsigned 20-bit immediate (-0X80000 to 0xFFFFF) Note: -0X7FFF to -1 are interpreted as 0X7FFF to 0xFFFFF
#i32	: Unsigned 32-bit immediate (-0X80000000 to 0xFFFFFFFF) Note: -0X80000000 to -1 are interpreted as 0X80000000 to 0xFFFFFFFF
#s5	: Signed 5-bit immediate (-16 to 15)
#s10	: Signed 10-bit immediate (-512 to 508, multiple of 4 only)
#u4	: Unsigned 4-bit immediate (0 to 15)
#u5	: Unsigned 5-bit immediate (0 to 31)
#u8	: Unsigned 8-bit immediate (0 to 255)
#u10	: Unsigned 10-bit immediate (0 to 1020, multiple of 4 only)
@dir8	: Unsigned 8-bit direct address (0 to 0xFF)
@dir9	: Unsigned 9-bit direct address (0 to 0X1FE, multiple of 2 only)
@dir10	: Unsigned 10-bit direct address (0 to 0X3FC, multiple of 4 only)
label9	: Signed 9-bit branch address (-0X100 to 0XFC, multiple of 2 only)
label12	: Signed 12-bit branch address (-0X800 to 0X7FC, multiple of 2 only)
label20	: Signed 20-bit branch address (-0X80000 to 0X7FFFF)
label32	: Signed 32-bit branch address (-0X80000000 to 0X7FFFFFFF)
@Ri	: Register indirect (R0 to R15, AC, FP, SP)
@Rj	: Register indirect (R0 to F15, AC, FP, SP)
@(R13, Rj)	: Register relative indirect (Rj: R0 to R15, AC, FP, SP)
@(R14, disp10)	: Register relative indirect (disp10: -0X200 to 0X1FC, multiple of 4 only)
@(R14, disp9)	: Register relative indirect (disp9: -0X100 to 0XFE, multiple of 2 only)
@(R14, disp8)	: Register relative indirect (disp8: -0X80 to 0X7F)
@(R15, udisp6)	: Register relative (udisp6: 0 to 60, multiple of 4 only)
@Ri+	: Register indirect with post-increment (R0 to R15, AC, FP, SP)
@R13+	: Register indirect with post-increment (R13, AC)
@SP+	: Stack pop
@-SP	: Stack push
(reglist)	: Register list

3. Instruction Types

4. Detailed Description of Instructions

- Add/subtract operation instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
ADD Rj, Ri	A C'	A6	1	C C C C	Ri + Rj → Ri	MSB is interpreted as a sign in assembly language
* ADD #s5, Ri		A4	1	C C C C	Ri + s5 → Ri	
ADD #u4, Ri	C C	A4	1	C C C C	Ri + extu (i4) → Ri	Zero-extension
ADD2 #u4, Ri		A5	1	C C C C	Ri + extu (i4) → Ri	
ADDC Rj, Ri	A	A7	1	C C C C	Ri + Rj + c → Ri	Add operation with sign
ADDN Rj, Ri	A C'	A2	1	— — —	Ri + Rj → Ri	MSB is interpreted as a sign in assembly language
* ADDN #s5, Ri		A0	1	— — —	Ri + s5 → Ri	
ADDN #u4, Ri	C C	A0	1	— — —	Ri + extu (i4) → Ri	Zero-extension
ADDN2 #u4, Ri		A1	1	— — —	Ri + extu (i4) → Ri	
SUB Rj, Ri	A	AC	1	C C C C	Ri - Rj → Ri	
SUBC Rj, Ri	A	AD	1	C C C C	Ri - Rj - c → Ri	Subtract operation with carry
SUBN Rj, Ri	A	AE	1	— — —	Ri - Rj → Ri	

- Compare operation instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
CMP Rj, Ri	A C'	AA	1	C C C C	Ri - Rj	MSB is interpreted as a sign in assembly language
* CMP #s5, Ri		A8	1	C C C C	Ri - s5	
CMP #u4, Ri	C C	A8	1	C C C C	Ri + extu (i4)	Zero-extension
CMP2 #u4, Ri		A9	1	C C C C	Ri + extu (i4)	

- Logical operation instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
AND Rj, Ri	A	82	1	C C --	Ri & = Rj	Word
AND Rj, @Ri	A	84	1+2a	C C --	(Ri) & = Rj	Word
ANDH Rj, @Ri	A	85	1+2a	C C --	(Ri) & = Rj	Half word
ANDB Rj, @Ri	A	86	1+2a	C C --	(Ri) & = Rj	Byte
OR Rj, Ri	A	92	1	C C --	Ri = Rj	Word
OR Rj, @Ri	A	94	1+2a	C C --	(Ri) = Rj	Word
ORH Rj, @Ri	A	95	1+2a	C C --	(Ri) = Rj	Half word
ORB Rj, @Ri	A	96	1+2a	C C --	(Ri) = Rj	Byte
EOR Rj, Ri	A	9A	1	C C --	Ri ^ = Rj	Word
EOR Rj, @Ri	A	9C	1+2a	C C --	(Ri) ^ = Rj	Word
EORH Rj, @Ri	A	9D	1+2a	C C --	(Ri) ^ = Rj	Half word
EORB Rj, @Ri	A	9E	1+2a	C C --	(Ri) ^ = Rj	Byte

MB91103 Series

- Bit manipulation instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
BANDL #u4, @Ri	C	80	1+2a	— — —	(Ri) & = (0xF0 + u4)	Manipulate lower 4 bits
BANDH #u4, @Ri	C	81	1+2a	— — —	(Ri) & = ((u4 << 4) + 0x0F)	Manipulate upper 4 bits
* BAND #u8, @Ri	*1				(Ri) & = u8	
BORL #u4, @Ri	C	90	1+2a	— — —	(Ri) = u4	Manipulate lower 4 bits
BORH #u4, @Ri	C	91	1+2a	— — —	(Ri) = (u4 << 4)	Manipulate upper 4 bits
* BOR #u8, @Ri	*2				(Ri) = u8	
BEORL #u4, @Ri	C	98	1+2a	— — —	(Ri) ^ = u4	Manipulate lower 4 bits
BEORH #u4, @Ri	C	99	1+2a	— — —	(Ri) ^ = (u4 << 4)	Manipulate upper 4 bits
* BEOR #u8, @Ri	*3				(Ri) ^ = u8	
BTSTL #u4, @Ri	C	88	2+a	0 C —	(Ri) & u4	Test lower 4 bits
BTSTH #u4, @Ri	C	89	2+a	C C —	(Ri) & (u4 << 4)	Test upper 4 bits

*1: Assembler generates BANDL if result of logical operation “u8&0x0F” leaves an active (set) bit and generates BANDH if “u8&0xF0” leaves an active bit. Depending on the value in the “u8” format, both BANDL and BANDH may be generated.

*2: Assembler generates BORL if result of logical operation “u8&0x0F” leaves an active (set) bit and generates BORH if “u8&0xF0” leaves an active bit.

*3: Assembler generates BEORL if result of logical operation “u8&0x0F” leaves an active (set) bit and generates BEORH if “u8&0xF0” leaves an active bit.

- Add/subtract operation instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
MUL Rj, Ri	A	AF	5	C C C —	Ri * Rj → MDH, MDL	32-bit*32-bit = 64-bit
MULU Rj, Ri	A	AB	5	C C C —	Ri * Rj → MDH, MDL	Unsigned
MULH Rj, Ri	A	BF	3	C C — —	Ri * Rj → MDL	16-bit*16-bit = 32-bit
MULUH Rj, Ri	A	BB	3	C C — —	Ri * Rj → MDL	Unsigned
DIVOS Ri	E	97-4	1	— — —		Step calculation
DIVOU Ri	E	97-5	1	— — —		32-bit/32-bit = 32-bit
DIV1 Ri	E	97-6	d	— C — C		
DIV2 Ri	E	97-7	1	— C — C		
DIV3	E	9F-6	1	— — —		
DIV4S	E	9F-7	1	— — —		
* DIV Ri	*1		36	— C — C	MDL/Ri → MDL, MDL%Ri → MDH	
* DIVU Ri	*2		33	— C — C	MDL/Ri → MDL, MDL%Ri → MDH	

*1: DIVOS, DIV1 × 32, DIV2, DIV3 and DIV4S are generated. A total instruction code length of 72 bytes.

*2: DIVOU and DIV1 × 32 are generated. A total instruction code length of 66 bytes.

- Shift instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
LSL Rj, Ri	A	B6	1	C C - C	Ri < < Rj → Ri	
* LSL #u5, Ri (u5: 0 ~ 31)	C'	B4	1	C C - C	Ri < < u5 → Ri	
LSL #u4, Ri	C	B4	1	C C - C	Ri < < u4 → Ri	
* LSL2 #u4, Ri	C	B5	1	C C - C	Ri < < (u4 + 16) → Ri	
LSR Rj, Ri	A	B2	1	C C - C	Ri > > Rj → Ri	
* LSR #u5, Ri (u5: 0 ~ 31)	C'	B0	1	C C - C	Ri > > u5 → Ri	
LSR #u4, Ri	C	B0	1	C C - C	Ri > > u4 → Ri	
* LSR2 #u4, Ri	C	B1	1	C C - C	Ri > > (u4 + 16) → Ri	
ASR Rj, Ri	A	BA	1	C C - C	Ri > > Rj → Ri	
* ASR #u5, Ri (u5: 0 ~ 31)	C'	B8	1	C C - C	Ri > > u5 → Ri	
ASR #u4, Ri	C	B8	1	C C - C	Ri > > u4 → Ri	
* ASR2 #u4, Ri	C	B9	1	C C - C	Ri > > (u4 + 16) → Ri	

- Immediate value set/16-bit/32-bit immediate value transfer instruction

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
LDI:32 #i32, Ri	E	9F-8	3	-----	i32 → Ri	
LDI:20 #i20, Ri	C	9B	2	-----	i20 → Ri	
LDI:8 #i8, Ri	B	C0	1	-----	i8 → Ri	
* LDI # {i8 i20 i32}, Ri					{i8 i20 i32} → Ri	Upper 12-bit is zero-extended Upper 24-bit is zero-extended

* : If an immediate value is given in absolute, assembler automatically makes i8, i20 or i32 selection.

If an immediate value contains relative value or external reference, assembler selects i32.

- Memory load instructions

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
LD @Rj, Ri	A	04	b	-----	(Rj) → Ri

BP	label9	D	E7	2/1	----	PCs/N == 0	
BV	label9	D	E8	2/1	----	PCs/V == 1	
BNV	label9	D	E9	2/1	----	PCs/V == 0	
BLT	label9	D	EA	2/1	----	PCs/V xor N == 1	
BGE	label9	D	EB	2/1	----	PCs/V xor N == 0	
BLE	label9	D	EC	2/1	----	PCs/(V xor N) or Z == 1	
BGT	label9	D	ED	2/1	----	PCs/(V xor N) or Z == 0	
BLS	label9	D	EE	2/1	----	PCs/C or Z == 1	
BHI	label9	D	EF	2/1	----	PCs/C or Z == 0	

Notes:

- Number of cycles "2/1" indicates that 2 cycles are needed for branch and 1 cycle needed for non-branch.
- Assembler calculates and set the result in the field of rel11 and rel8 format given by hardware specification. (label12 - PC - 2)/2 → rel11, (label9 - PC - 2)/2 → rel8, label12, label9 are signed.
- RETI must be operated while S flag = 0.

MB91103 Series

- Branch instructions with delays

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
JMP:D @Ri	E	9F-0	1	-----	Ri → PC	
CALL:D label12	F	D8	1	-----	PC + 4 → RP, PC + 2 + (label12 - PC - 2) → PC	
CALL:D @Ri	E	9F-1	1	-----	PC + 4 → RP, Ri → PC	
RET:D	E	9F-2	1	-----	RP → PC	Return
BRA:D label9	D	F0	1	-----	PC + 2 + (label9 - PC - 2) → PC	
BNO:D label9	D	F1	1	-----	Non-branch	
BEQ:D label9	D	F2	1	-----	if (Z == 1) then PC + 2 + (label9 - PC - 2) → PC	
BNE:D label9	D	F3	1	-----	PCs/Z == 0	
BC:D label9	D	F4	1	-----	PCs/C == 1	
BNC:D label9	D	F5	1	-----	PCs/C == 0	
BN:D label9	D	F6	1	-----	PCs/N == 1	
BP:D label9	D	F7	1	-----	PCs/N == 0	
BV:D label9	D	F8	1	-----	PCs/V == 1	
BNV:D label9	D	F9	1	-----	PCs/V == 0	
BLT:D label9	D	FA	1	-----	PCs/V xor N == 1	
BGE:D label9	D	FB	1	-----	PCs/V xor N == 0	
BLE:D label9	D	FC	1	-----	PCs/(V xor N) or Z == 1	
BGT:D label9	D	FD	1	-----	PCs/(V xor N) or Z == 0	
BLS:D label9	D	FE	1	-----	PCs/C or Z == 1	
BHI:D label9	D	FF	1	-----	PCs/C or Z == 0	

- Notes:
- Assembler calculates and set the result in the field of rel11 and rel8 format given by hardware specification. $(label12 - PC - 2)/2 \rightarrow rel11$, $(label9 - PC - 2)/2 \rightarrow rel8$, label12, label9 are signed.
 - Delayed branch operation always executes next instruction (delay slot) before making a branch.
 - Instructions allowed to be stored in the delay slot are all 1-cycle, a, b, c and d-cycle instructions. Multiple-cycle instructions are not allowed on the delay slot.

- Others

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
NOP	E	9F-A	1	----	No changes	
ANDCCR #u8 ORCCR #u8	D D	83 93	c c	C C C C C C C C	CCR and u8 → CCR CCR or u8 → CCR	
STILM #u8	D	87	1	----	i8 → ILM	Set ILM immediate value
ADDSP #s10 *1	D	A3	1	----	R15 + = s10	ADD SP instruction
EXTSB Ri EXTUB Ri EXTSH Ri EXTUH Ri	E E E E	97-8 97-9 97-A 97-B	1 1 1 1	----	Sign extension 8 → 32-bit Zero extension 8 → 32-bit Sign extension 16 → 32 bit Zero extension 16 → 32-bit	
LDM0 (reglist) LDM1 (reglist) * LDM (reglist) *2	D D	8C 8D		----	(R15) → reglist, R15 increment (R15) → reglist, R15 increment (R15) → reglist, R15 increment	Load-multi R0 to R7 Load-multi R8 to R15 Load-multi R0 to R15
STM0 (reglist) STM1 (reglist) * STM2 (reglist) *3	D D	8E 8F		----	R15 decrement, reglist → (R15) R15 decrement, reglist → (R15) R15 decrement, reglist → (R15)	Store-multi R0 to R7 Store-multi R8 to R15 Store-multi R0 to R15
ENTER #u10 *4	D	0F	1+a	----	R14 → (R15 - 4), R15 - 4 → R14, R15 - u10 → R15	Entrance processing of function
LEAVE	E	9F-9	b	----	R14 + 4 → R15, (R15 - 4) → R14	Exit processing of function
XCHB @Rj, Ri	A	8A	2a	----	Rj → TEMP (Rj) → Ri TEMP → (Rj)	For SEMAFO management Byte data

*1: For s10 format, assembler calculates s10/4 and convert to s8 format. s10 is signed.

*2: If either of R0 to R7 is specified in reglist, assembler generates LDM0. If either of R8 to R15 is specified, assembler generates LDM1. Both LDM0 and LDM1 may be generated.

*3: If either of R0 to R7 is specified in reglist, assembler generates STM0. If either of R8 to R15 is specified, assembler generates STM1. Both STM0 and STM1 may be generated.

*4: For u10 format, assembler calculates u10/4 and convert to s8 format. u10 is unsigned.

Notes:

- Number of cycles needed for execution of LDM0 (reglist) and LDM1 (reglist) is given by the following calculation;
 $a*(n - 1) + b + 1$ where n is number of registers specified.
- Number of cycles needed for execution of STM0 (reglist) and STM1 (reglist) is given by the following calculation;
 $a*n + 1$ where n is number of registers specified.

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
