Single/Dual/Quad, Low-Cost, Single-Supply, Rail-to-Rail Op Amps with Shutdown

MAX4480-MAX4483

General Description

The MAX4480–MAX4483 low-cost, general-purpose op amps offer Rail-to-Rail® outputs, draw only 50µA of quiescent current, and operate from a single +2.5V to +5.5V supply. For additional power conservation, the MAX4481 offers a low-power shutdown mode that reduces supply current to 1µA (max) and puts the amplifier's output in a high-impedance state. These devices are unity-gain stable with capacitive loads up to 400pF. The MAX4480–MAX4483 are specified to +125°C, making them suitable for use in a variety of harsh environments, such as automotive applications.

The MAX4480 is a single amplifier offered in a tiny 5-pin SC70 package. The MAX4481 is a single amplifier with a low-power shutdown mode that reduces supply current to <1µA and comes in a 6-pin SC70 package. The MAX4482 is a dual amplifier and comes in the space-saving 8-pin SOT23 package. The MAX4483 is a quad amplifier and comes in a 14-pin TSSOP package. All devices are specified for operation across the -40°C to +125°C automotive temperature range.

Selector Guide

PART	NO. OF AMPLIFIERS PER PACKAGE	SHUTDOWN MODE
MAX4480	1	No
MAX4481	1	Yes
MAX4482	2	No
MAX4483	4	No

Applications

- Single-Supply Zero-Crossing Detectors
- Instruments and Terminals
- Portable Communications
- Electronic Ignition Modules
- Infrared Receivers
- Sensor Signal Detection

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

Features

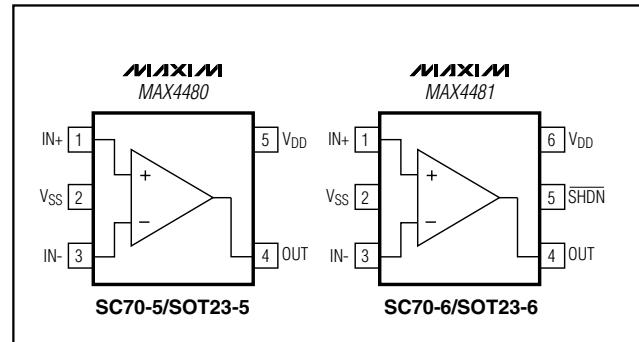

- ◆ Single +2.5V to +5.5V Supply Voltage Range
- ◆ 50µA Quiescent Current per Amplifier
- ◆ 1µA max Shutdown Mode (MAX4481)
- ◆ Available in Space-Saving Packages
 - 5-Pin SC70 (MAX4480)
 - 6-Pin SC70 (MAX4481)
 - 8-Pin SOT23 (MAX4482)
- ◆ 105dB AVOL with 5kΩ Load
- ◆ 0.005% THD with 100kΩ Load
- ◆ Rail-to-Rail Output Voltage Swing
- ◆ 3.0mA of Sink and Source Load Current
- ◆ Unity-Gain Stable up to CLOAD = 400pF

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

Rail-to-Rail Output Stage

The MAX4480–MAX4483 can drive a $5k\Omega$ load and still typically swing within 80mV of the supply rails. Figure 1 shows the MAX4480 output voltage swing configured with $A_v = +10V/V$.

Driving Capacitive Loads

Driving a capacitive load can cause instability in many op amps, especially those with low quiescent current. The MAX4480–MAX4483 are unity-gain stable for a range of capacitive loads up to above 400pF. Figure 2 shows the MAX4480 response with an excessive capacitive load. Adding a series resistor between the output and the load capacitor (Figure 3) improves the

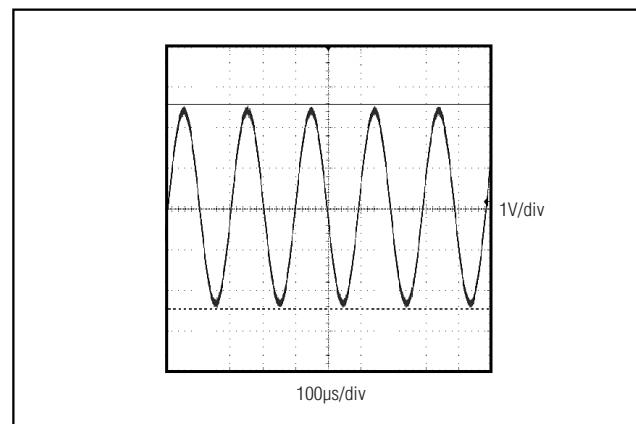

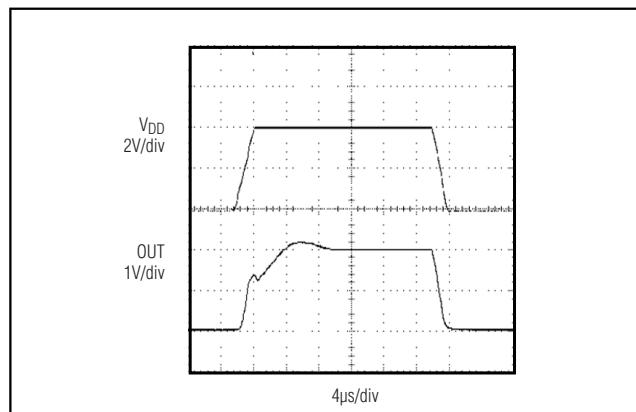

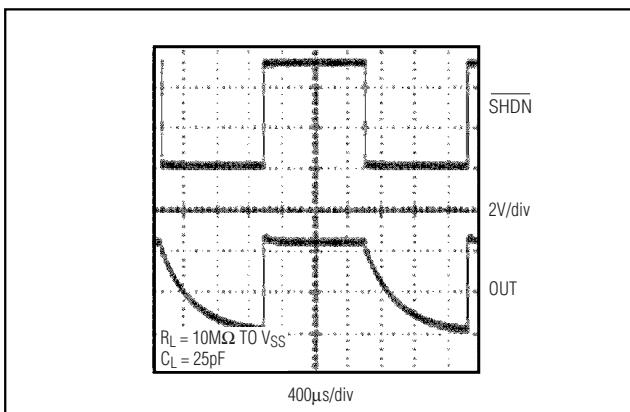

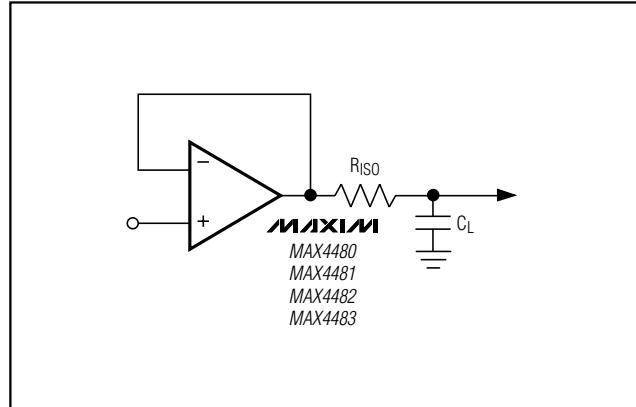

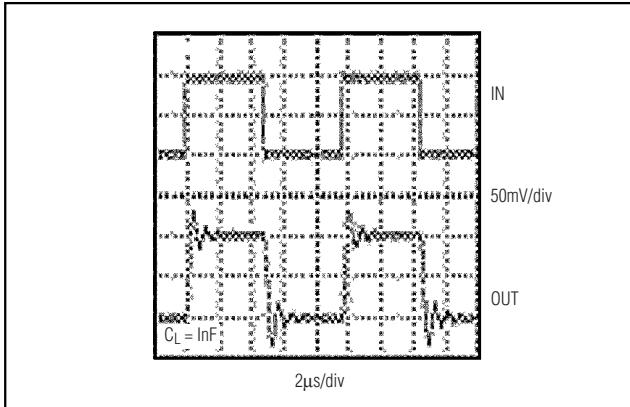

Figure 1. Rail-to-Rail Output Operation

circuit's response by isolating the load capacitance from the op amp's output.

Applications Information

Shutdown Mode

The MAX4481 features a low-power shutdown mode. When SHDN goes low, the supply current drops to $0.1\mu\text{A}$ (typ) and the output enters a high-impedance state. Pull SHDN high to enable the amplifier. Do not leave SHDN floating. Figure 4 shows the shutdown waveform.

Power-Up

The MAX4480–MAX4483 outputs typically settle within $50\mu\text{s}$ after power-up. Figure 5 shows the output voltage on power-up and power-down.

Power Supplies and Layout
The MAX4480–MAX4483 operate from a single $+2.5\text{V}$ to $+5.5\text{V}$ power supply. Bypass the power supply with a $0.1\mu\text{F}$ capacitor to ground.

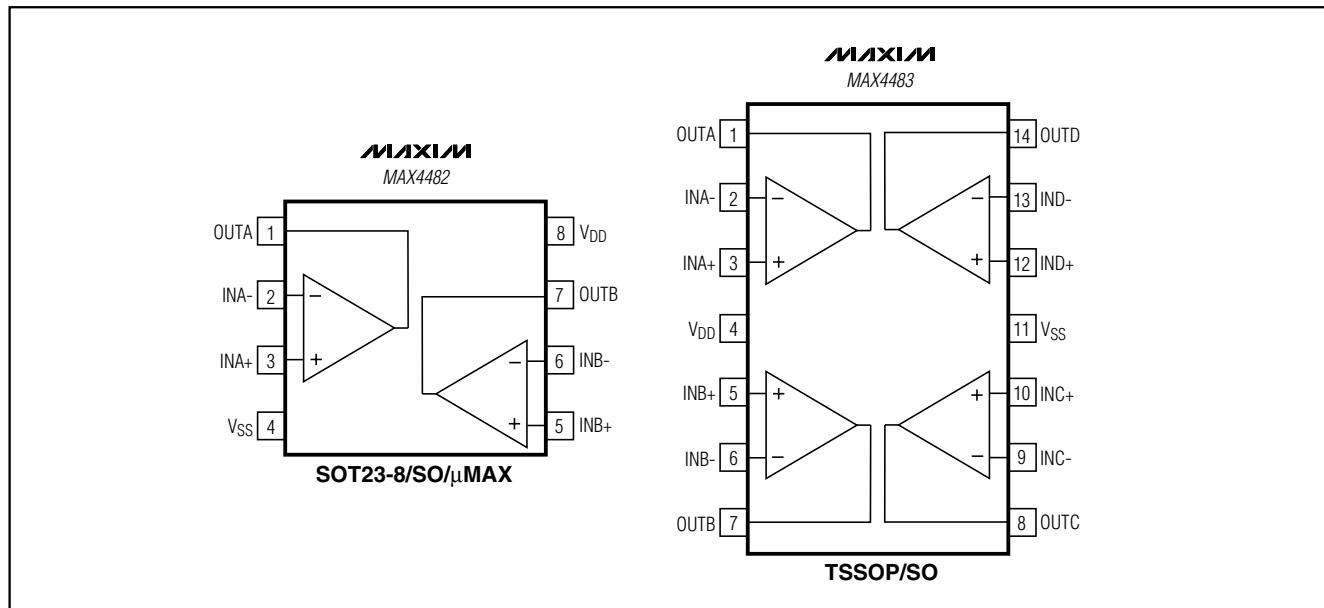

Good layout techniques optimize performance by decreasing the amount of stray capacitance at the op amp's inputs and outputs. To decrease stray capacitance, minimize trace lengths by placing external components close to the op amp's pins.
