

3-Terminal Fixed Negative Voltage Regulator

❖ GENERAL DESCRIPTION

The AX7905/12 series of fixed output negative voltage regulators are intended as complements to the popular TS7800 series device. These negative regulators are available in the same seven-voltage options as the AX7905/12 devices. In addition, one extra voltage option commonly employed in MECL systems is also available in the negative AX7905/12 Series. Available in fixed output voltage options from -5.0 to -24 volts, these regulators employ current limiting, thermal shutdown, and safe-area compensation--making them remarkably rugged under most operating conditions. With adequate heat sinking they can deliver output currents in excess of 1 ampere.

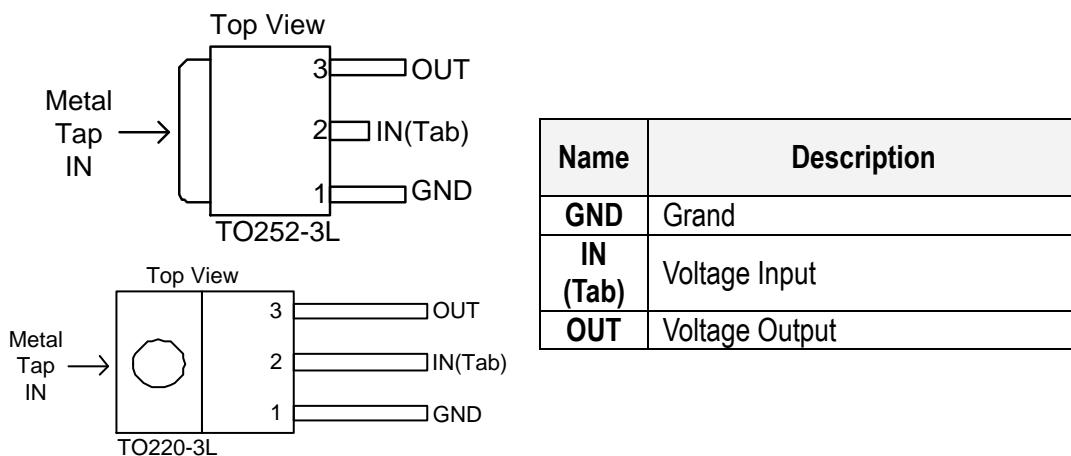

This series is offered in 3-pin TO-220 and TO252 package.

❖ FEATURES

- Output Voltage: -5 and -12V
- Output current up to 1A
- No external components required
- Internal thermal overload protection
- Internal short-circuit current limiting
- Output transistor safe-area compensation
- Output voltage offered in 4% tolerance

❖ PIN ASSIGNMENT

The packages of AX7905/12 are TO220-3L and TO252-3L; the pin assignment is given by:

Note1: Pulse testing techniques are used to maintain the junction temperature as close to the ambient temperature as possible, and thermal effects must be taken into account separately.

Note2: This specification applies only for DC power dissipation permitted by absolute maximum ratings.

❖ APPLICATION CIRCUIT

Note1: A common ground is required between the input and the output voltages. The input voltage must remain typically 2.0V above the output voltage even during the low point on the Input ripple voltage.

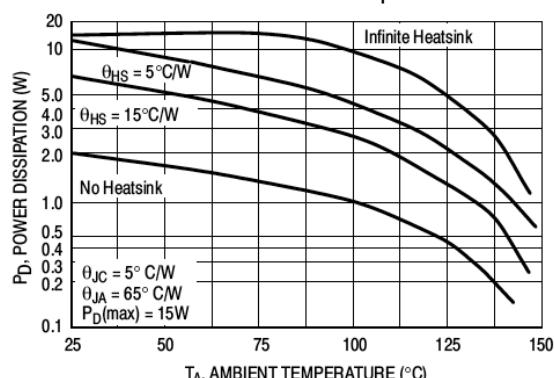

Note2: XX = these two digits of the type number indicate voltage.

* = Cin is required if regulator is located an appreciable distance from power supply filter.

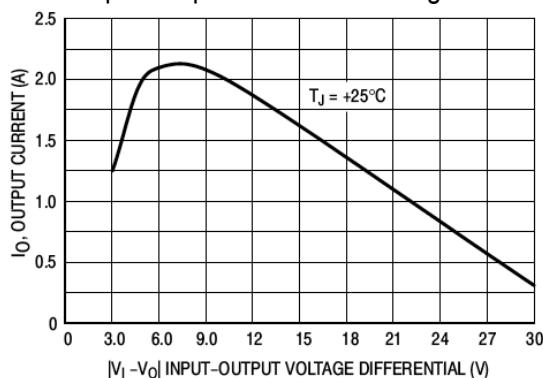

** = Co is not needed for stability; however, it does improve transient response.
