- Quartz SAW Stabilized and Filtered "Diff Sine" Technology
- Fundamental-Mode Oscillation at 666.51 MHz
- Voltage Tunable for Phase Lock Loop Operations
- Optical Timing Reference for Forward Error Correction Applications

The output of this device is generated and filtered by narrowband quartz SAW elements at 666.51 MHz . The configuration of this clock is intended to provide a pure signal for optical timing applications in noisy signal environments. The Q/Qbar differential output swing of $\pm 1$ volt about 0 vdc has symmetry better than $\pm 1 \%$ into loads from 40 ohms to 70 ohms; determined by customer application. The long term frequency accuracy is set by an external reference source allowing this device to complete a Phase Lock Loop design without the usual noise and jitter problems associated with PLL's.

Absolute Maximum Ratings

| Rating | Value | Units |
| :--- | :---: | :---: |
| DC Suppy Voltage | 0 to 5.5 | VDC |
| Tune Voltage | 0 to 6 | VDC |
| Case Temperature | -55 to 100 | ${ }^{\circ} \mathrm{C}$ |

CAUTION: Electrostatic Sensitive Device. Observe precautions for handling. COCOM CAUTION: Approval by the U.S. Department of Commerce is required prior to export of this device.

## Notes:

1. Unless otherwise noted, all specifications include any combination of load VSWR, Vcc, and temperature, with Q and $\overline{\mathrm{Q}}$ terminated into 50 ohm loads to ground (see typical test circuit).
2. Useful tuning range is in excess of what is required over temp, aging, pushing, pulling \& accuracy.
3. The design, manufacturing process, and specifications of this device are subject to change without notice.
4. Only under the nominal conditions of $50 \Omega$ load impedance with VSWR $\leq 1.2$ and nominal power supplyvoltage.
5. Symmetry is defined as the pulse width (in percent of total period) measured at the $50 \%$ points of $Q$ or $Q$ (see timing definitions).
6. Jitter and other spurious outputs induced by externally generated electrical noise on $\mathrm{V}_{\mathrm{CC}}$ or mechanical vibration are not included in this specification, except where noted. External voltage regulation and careful PCB layout are recommended for optimum performance.
7. Applies to period jitter of Q and Q. Measurements are made with the Tektronix CSA803 signal analyzer with at least 1000 samples.
8. Linearity is a function of the percentage variation from a permitted linear deviation versus the amount of frequency tune range (see linearity definition).
9. One or more of the following United States patents apply: 4,616,197; 4,670,681; 4,760,352.
