

GA100SICP12-227

Silicon Carbide Junction Transistor/Schottky Diode Co-pack

 V_{DS} = 1200 V $R_{DS(ON)}$ = 12 m Ω $I_{D (Tc = 25^{\circ}C)}$ = 200 A $h_{FE (Tc = 25^{\circ}C)}$ 100

Features

- 175°C Maximum Operating Temperature
- · Gate Oxide free SiC switch
- Exceptional Safe Operating Area
- Integrated SiC Schottky Rectifier
- Excellent Gain Linearity
- Temperature Independent Switching Performance
- Low output capacitance
- Positive temperature co-efficient of R_{DS,ON}
- Suitable for connecting an anti-parallel diode

Advantages

- Compatible with Si MOSFET/IGBT Gate Drive ICs
- > 20 µs Short-Circuit Withstand Capability
- Lowest-in-class Conduction Losses
- High Circuit Efficiency
- Minimal Input Signal distortion
- High Amplifier Bandwidth
- Reduced cooling requirements
- Reduced system size

Package

RoHS Compliant

SOT-227

Applications

- Down Hole Oil Drilling, Geothermal Instrumentation
- Hybrid Electric Vehicles (HEV)
- Solar Inverters
- Switched-Mode Power Supply (SMPS)
- Power Factor Correction (PFC)
- Induction Heating
- Uninterruptible Power Supply (UPS)
- Motor Drives

Gate Drive Theory of Operation for the GA100SICP12-227

The SJT transistor is a current controlled transistor which requires a positive gate current for turn-on as well as to remain in on-state. An ideal gate current waveform for ultra-fast switching of the SJT, while maintaining low gate drive losses, is shown in Figure 22.

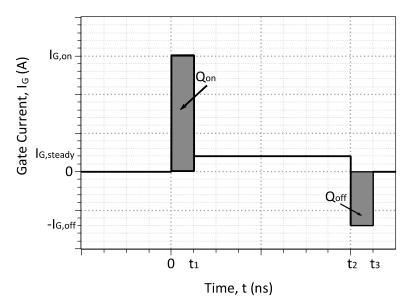

Figure 22: Idealized Gate Current Waveform

Gate Currents, $\textbf{I}_{G,pk}\textit{I-}\textbf{I}_{G,pk}$ and Voltages during Turn-On and Turn-Off

An SJT is rapidly switched from its blocking state to on-state, when the necessary gate charge, Q_G , for turn-on is supplied by a burst of high gate current, $I_{G,on}$, until the gate-source capacitance, C_{GS} , and gate-drain capacitance, C_{GD} , are fully charged.

$$I_{G,on} * t_1 \ge Q_{gs} + Q_{gd}$$

The $I_{G,pon}$ pulse should ideally terminate, when the drain voltage falls to its on-state value, in order to avoid unnecessary drive losses during the steady on-state. In practice, the rise time of the $I_{G,on}$ pulse is affected by the parasitic inductances, L_{par} in the module and drive circuit. A voltage developed across the parasitic inductance in the source path, L_s , can de-bias the gate-source junction, when high drain currents begin to flow through the device. The applied gate voltage should be maintained high enough, above the $V_{GS,ON}$ level to counter these effects.

A high negative peak current, $-I_{G,off}$ is recommended at the start of the turn-off transition, in order to rapidly sweep out the injected carriers from the gate, and achieve rapid turn-off. While satisfactory turn off can be achieved with $V_{GS} = 0$ V, a negative gate voltage V_{GS} may be used in order to speed up the turn-off transition.

Steady On-State

After the device is turned on, I_G may be advantageously lowered to $I_{G,steady}$ for reducing unnecessary gate drive losses. The $I_{G,steady}$ is determined by noting the DC current gain, h_{FE} , of the device

The desired $I_{G,steady}$ is determined by the peak device junction temperature T_J during operation, drain current I_D , DC current gain h_{FE} , and a 50 % safety margin to ensure operating the device in the saturation region with low on-state voltage drop by the equation:

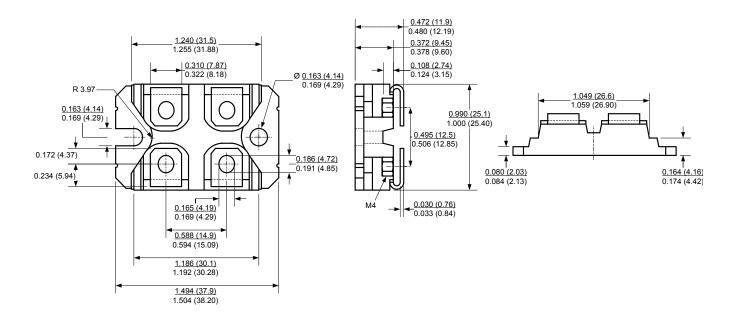

$$I_{G,steady} \approx \frac{I_D}{h_{FE}(T, I_D)} * 1.5$$

Package Dimensions:

SOT-227

PACKAGE OUTLINE

- 1. CONTROLLED DIMENSION IS INCH. DIMENSION IN BRACKET IS MILLIMETER.
 2. DIMENSIONS DO NOT INCLUDE END FLASH, MOLD FLASH, MATERIAL PROTRUSIONS
