

MegaQ™: An Automatic Composite Video Equalizer, Fully-Adaptive to 1 Mile (1600m)

ISL59601, ISL59602, ISL59603, ISL59604, ISL59605

The ISL59601, ISL59602, ISL59603, ISL59604, and ISL59605 (the “MegaQ™” product family) are single-channel adaptive equalizers designed to automatically compensate for long runs of Cat 5/6 or RG-59 cable, producing high quality video output with no user interaction. The ISL59601 equalizes Cat 5/6 up to a distance of 1000 feet (300 meters), while the ISL59605 equalizes up to 5300 feet (1600 meters).

MegaQ™ compensates for high frequency cable losses of up to 60dB (ISL59605) at 5MHz as well as source amplitude variations up to ±3dB.

The ISL59601, ISL59602, ISL59603, ISL59604, and ISL59605 operate from a single +5V supply. Inputs are AC-coupled and internally DC-restored. The output can drive 2V_{p-p} into two source-terminated 75Ω loads (AC-coupled or DC-coupled).

Features

- ISL59605 Equalizes Up to 1 Mile (1600m) of Cat 5/6 and Up to 6000 Feet (1800m) of RG-59
- Fully Automatic, Stand-Alone Operation - No User Adjustment Required
- ±8kV ESD Protection on All Inputs
- Automatic Cable Type Compensation
- Compatible with Color or Monochrome, NTSC or PAL Signals
- Automatic Polarity Detection and Inversion
- Compensates for ±3dB Source Variation (in Addition to Cable Losses)
- Optional Serial Interface Adds Additional Functionality
- 5MHz -3dB Bandwidth
- Works with Single-Ended or Differential Inputs
- Output Drives Up to Two 150Ω Video Loads

Applications

- Surveillance Video
- Video Distribution

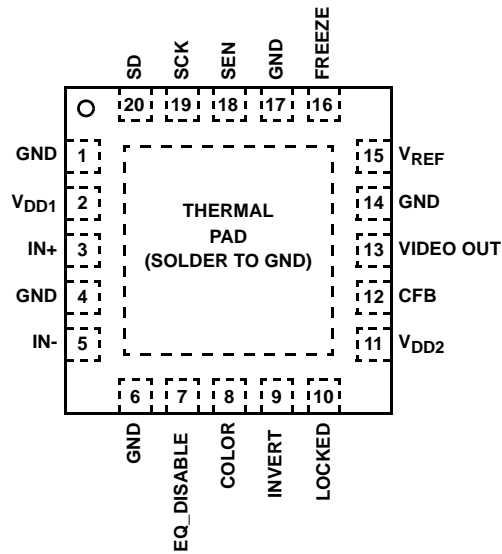

Typical Application

Pin Descriptions

| PIN NUMBER | PIN NAME | DESCRIPTION |
|-------------------------|------------------|---|
| INPUTS | | |
| 3 | IN+ | High impedance analog input. This is the positive differential video input. Input signals are externally AC-coupled with an external 1.0 μ F capacitor. See Applications Information section for information regarding input network for Cat x and coax cables. |
| 5 | IN- | High impedance analog input. This is the negative differential video input. Input signals are externally AC-coupled with an external 1.0 μ F capacitor. See Applications Information section for information regarding input network for Cat x and coax cables. |
| 12 | CFB | Analog input. Bypass to ground with a 1500pF capacitor and connect to VIDEO OUT via a 0.047 μ F capacitor in series with a 300 Ω resistor. |
| OUTPUTS | | |
| 13 | VIDEO OUT | Single-ended video output. The internal AGC sets this level to 2V _{P-P} for a nominal 1V _{P-P} (pre-cable) video source. |
| DIGITAL I/O | | |
| 7 | EQ_DISABLE | Digital Input. Equalizer Disable. 0: Normal Operation 1: Disables the equalizer to allow for insertion of upstream data onto the signal path, e.g. RS-485. This pin must be asserted high or low. Do not float this pin. |
| 8 | COLOR | Digital I/O. Color Indicator/Override. 0: Monochrome 1: Color When used as an output, this pin indicates whether the incoming signal does or does not have a colorburst. When used as an input, this pin forces the state machine to into monochrome or color mode. See Figure 49 and associated text for more information on functionality. When COLOR is not externally driven, it is an output pin with a 13k (typical) output impedance. It is capable of driving 5V, high-impedance CMOS logic. Note: The COLOR indicator may be invalid for monochrome signals over greater than ~4800 feet. The device will still equalize properly if this occurs. |
| 9 | INVERT | Digital I/O. Polarity Indicator/Override. 0: Nominal Polarity. 1: Inverted Polarity. When used as an output, this pin indicates the polarity of the incoming signal. When used as an input, this pin controls whether or not the input signal is inverted in the signal chain. See Figure 48 and associated text for more information on functionality. When INVERT is not externally driven, it is an output pin with a 13k (typical) output impedance. It is capable of driving 5V, high-impedance CMOS logic. In stand-alone mode, toggling this pin high-low-high or low-high-low will make the equalizer reacquire the signal. |
| 10 | LOCKED | Digital Output. 0: Signal is not equalized (or not present). 1: Signal is equalized and settled. Note: The LOCKED indicator may be invalid for monochrome signals over greater than ~4800 feet. The device will still equalize properly if this occurs. |
| 16 | FREEZE | Digital Input. Freezes equalizer in its current EQ state. 0: Continuous Update 1: Freeze EQ in current state. For stand-alone operations, connect FREEZE to the LOCKED pin to enter the recommended Lock Until Reset mode. Tie this pin low if unused. |
| SERIAL INTERFACE | | |
| 18 | SEN | Digital Input. Serial Interface Enable. This pin should be tied to ground when not in use. |
| 19 | SCK | Digital Input. Serial Interface Clock Signal. This pin should be tied to ground when not in use. |
| 20 | SD | Digital I/O. Serial Interface Data Signal. This pin should be tied to ground when not in use. |
| POWER | | |
| 2 | V _{DD1} | +5V power supply for analog equalizer. Isolate from +5V source with a ferrite bead and bypass to ground with a 0.1 μ F capacitor in parallel with a 4.7 μ F capacitor. |

ISL59601, ISL59602, ISL59603, ISL59604, ISL59605

Pin Descriptions (Continued)

| PIN NUMBER | PIN NAME | DESCRIPTION |
|--------------------|------------------|---|
| 11 | V _{DD2} | +5V power supply for output amplifier. Bypass to ground with a 0.1µF capacitor. |
| 15 | V _{REF} | Internally generated 2.5V reference. Bypass to ground with a low-ESR 0.47µF capacitor. Do not attach anything else to this pin. |
| 1, 4, 6, 14, 17 | GND | Ground |
| THERMAL PAD | | |
| EP | PAD | Solder the exposed thermal PAD to ground for best thermal and electrical performance. |

NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL59601](#), [ISL59602](#), [ISL59603](#), [ISL59604](#), [ISL59605](#). For more information on MSL please see techbrief [TB363](#).

Thermal Information

| | | |
|--------------------------------|---|------------------------|
| Thermal Resistance (Typical) | θ _{JA} (°C/W) | θ _{JC} (°C/W) |
| 20 Ld QFN Package (Notes 4, 5) | 40 | 3.7 |
| Storage Temperature | -65°C to +150°C | |
| Ambient Operating Temperature | -40°C to +85°C | |
| Die Junction Temperature | +150°C | |
| Pb-Free Reflow Profile | see link below http://www.intersil.com/pbfree/Pb-FreeReflow.asp | |

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief [TB379](#).
- For θ_{JC}, the “case temp” location is the center of the exposed metal pad on the package underside.

Electrical Specifications V_{DD} = V_{DD1} = V_{DD2} = +5V, source video amplitude before any cable loss = 1V_{P-P}, cable type = Cat 5, cable length = 0 feet, R_L = 150Ω (75Ω series + 75Ω load to ground), T_A = +25°C, exposed die plate = 0V, unless otherwise specified. Max cable length = 1000 feet for ISL59601, 2000 feet for ISL59602, 3000 feet for ISL59603, 4000 feet for ISL59604, and 5300 feet for ISL59605.

Functional Description

MegaQ™ Overview

MegaQ™ is a fully automated, stand-alone equalizer for composite video transmitted over UTP (Unshielded Twisted Pair, i.e. Cat 5, Cat 6, etc.) or coaxial (RG-59) cables.

Differential video signals sent over long distances of twisted pair wire exhibit large high frequency attenuation, resulting in loss of high frequency detail/blurring. The exact loss characteristic is a complex function of wire gauge, length, composition, and coupling to adjacent conductors.

The video signal can be restored by applying a filter with the exact inverse transfer function to the far end signal. MegaQ™ is designed to compensate for the losses due to long cables, and incorporates the functionality and flexibility to match a wide variety of cable types and loss characteristics.

While MegaQ™ was designed and optimized for stand-alone operation, with no need for any external control of any kind, it has an optional SPI serial interface with some additional features. See "Additional Equalization Modes Available With the Serial Interface" on page 22 for more information on the features and operation of the serial interface.

Equalization for Various Cable Types

TABLE 1. CABLE TYPES AND LENGTHS

| CABLE TYPE | MAXIMUM LENGTH SUPPORTED |
|--|--------------------------|
| Copper-Core | |
| CAT5/CAT5e | 5300 feet |
| CAT6 | 5600 feet |
| Coaxial - RG-59 | 6000 feet |
| CAT2/CAT3 (telephone wire) | 3000 feet |
| Belden IMSA Spec 39-2 581718 (3-pair traffic light cable) | 5300 feet |
| Non-Copper-Core* | |
| CAT5/CAT5e CCA (Copper-Coated Aluminum Core) | 2000 feet |
| Coaxial - RG-59 CCS (Copper-Coated Steel Core) | 1500 feet |

*Image quality will be significantly improved over unequalized cable, but there will still be some image smearing due to the high resistance of the core material.

FIGURE 45. APPLICATION CIRCUIT FOR UTP CABLE

Application Information

Unshielded Twisted Pair (UTP) App Circuit

Figure 45 shows the complete schematic for a MegaQ™ equalizer configured for unshielded twisted pair (UTP) cable. The input signal is terminated into the network formed by R1, R2, and R3. C1 and C2 AC-couple the signal into MegaQ™. To protect the front-end circuitry, 5V transorbs (Z1 and Z2) should be used instead of diodes because the signals on either differential input may swing far enough below ground to turn on a diode and distort the video.

On the output side, C5, R5, and C4 form a compensation network, while R6 provides 75Ω source-termination for the video output. MegaQ™ has a native gain of 6dB, so when VIDEO OUT is terminated into 75Ω (the input to a DVR, TV, etc.), R6 and the 75Ω terminator form a 2:1 divider, producing standard video amplitude across the 75Ω terminator.

Coax Input Circuit

Figure 46 shows the input termination recommended for coaxial cables. The differential termination resistance is now 75Ω to match the characteristic impedance of the RG-59 coax cable. C3 bypasses high-frequency noise on the coax ground line to system ground. This allows the coax ground to be independent of the system at low frequencies (DC to 50/60Hz) to accommodate differences in the ground potential of the remote video source(s). The coax startup network (D1, R4, C4) prevents a rare start-up condition that can occur when a high average-picture-level (e.g. white screen) video signal is present on the inputs before the power has been applied.

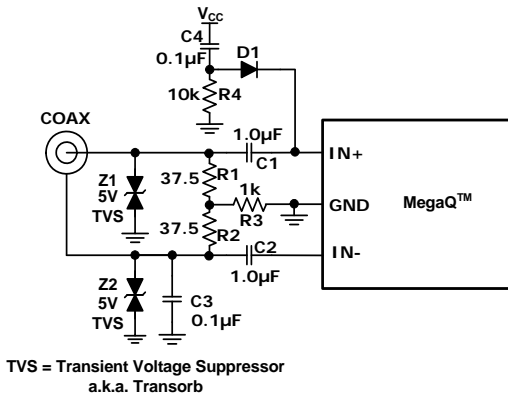

FIGURE 46. APPLICATION CIRCUIT FOR COAX CABLE

Dual UTP/Coax Input Circuit

If desired, it is also possible to support both UTP and coax cables with the same PCB layout using two SPST switches that are closed when in coax mode (Figure 47). Since UTP requires a 100Ω termination network while coax requires 75Ω, a switch to introduce a shunt 300Ω resistor when in coax mode will change the termination from 100Ω to 75Ω. A second switch is required to engage C3. The addition of the coax startup circuit (D1, R4, C4) can unbalance the capacitance of the differential pair and degrade the CMRR in UTP applications. This in turn could cause excess noise at long lengths of UTP. In UTP applications, if the output signal is too noisy at long distances, an optional capacitor Cx may be used to balance the capacitance of the differential

inputs. The value of Cx should be determined by calculating how much trace capacitance is added by the coax startup circuit. A typical value for a good layout is ~5pF. Note that only coax or UTP should be connected at any one time - this circuit does not multiplex between them.

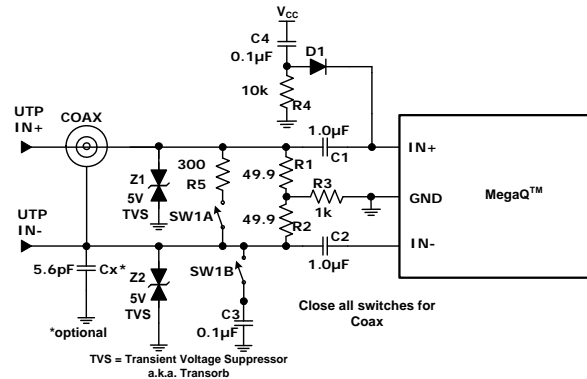

FIGURE 47. APPLICATION CIRCUIT FOR UTP/COAX CABLE

Input Multiplexing

Placing a semiconductor multiplexer in front of this part may increase high frequency attenuation and noise. However a low-capacitance mechanical relay may be acceptable. Note that changing from one channel to another in **Lock Until Reset** mode will require a reset (INVERT toggle) to trigger equalization of the new channel (see “Lock Until RESET” on page 21).

For best performance, do not multiplex the inputs to the equalizer - this can further degrade the signal. Instead, multiplex at the output after equalization has been performed.

Stand-Alone Operation and Configuration

In its default stand-alone configuration, MegaQ™ features two modes of automatic cable equalization: **Lock Until Reset** and **Continuous Update**. **Lock Until Reset** is the recommended mode for most applications.

LOCK UNTIL RESET

In the **Lock Until Reset** mode, once MegaQ™ finds the optimum equalization and the LOCKED signal goes high, the equalization is frozen and will not change until either the power is cycled or the INVERT signal is toggled, which initiates a re-equalization of the input signal. Re-equalization is usually only necessary during device/system evaluation - in normal operation MegaQ™ powers-up, acquires and equalizes the signal, and continues to equalize until/unless it is powered-down. If the signal is lost in **Lock Until Reset** mode, the LOCKED pin will not go low until/unless the device is reset by toggling the INVERT pin. A reset should only be necessary if the length or type of cable was changed without cycling power.

To enable the **Lock Until Reset** mode, tie the LOCKED output pin to the FREEZE input pin as shown in Figure 45 on page 20.

To generate a reset (and trigger a re-equalization), toggle the external INVERT pin to its opposite state for at least 1ms. Depending on the initial state of INVERT, this would be a high-low-high or low-high-low sequence.

CONTINUOUS UPDATE

In the **Continuous Update** mode, MegaQ™ will continuously try to find the optimum equalization solution. When the equalization has settled for 100 sequential video lines with no changes, the LOCKED pin will go high. However once lock is achieved, noise and average-picture-level changes may cause the device to unlock, causing some image perturbation while MegaQ™ re-equalizes.

The **Continuous Update** mode is enabled whenever the FREEZE pin is set to a logic low (grounded).

Polarity Detection and Correction

MegaQ™ features polarity detection and correction, automatically detecting incorrectly-wired input signals and inverting the signal inside the IC as necessary. The detected polarity is indicated by the state of the INVERT pin.

The INVERT pin has 2 modes of operation. It is typically used to indicate whether or not the incoming signal is inverted (the “+” signal on the “-” input and vice-versa). The state of the invert signal is then used to tell the signal processing logic whether or not to invert the signal in the signal path.

A logic high on INVERT indicates that the positive differential input signal is on IN- (pin 5) and the negative differential input signal is on IN+ (pin 3). A logic low indicates nominal polarity.

However the unique design of the INVERT I/O pin (Figure 48) also allows MegaQ™’s internal inversion detector to be overdriven externally, forcing MegaQ™ to invert or not invert the signal regardless of the state of the inversion detection function. This is not necessary in normal operation, but it may improve performance in particularly noisy environments when the polarity of the signal is guaranteed to be correct.

FIGURE 48. INVERT PIN STRUCTURE

The COLOR Pin

The color pin has 2 modes of operation. It is typically used to indicate whether or not the incoming signal has a colorburst or not. The state of the color signal is then used to tell the signal processing logic whether or not it can rely on the presence of a colorburst signal. A logic high indicates a color signal; a logic low indicates monochrome.

FIGURE 49. COLOR PIN STRUCTURE

However the unique design of the COLOR I/O pin (Figure 49) also allows MegaQ™’s internal color detector to be overdriven externally. This is not necessary in normal operation, but it may improve performance in particularly noisy environments when the signal type is predetermined.

Monochrome Video Signals

MegaQ™ will equalize monochrome signals to the same distance as color signals. However due to the high level of noise past ~4800 feet, the COLOR and LOCKED indicators may become invalid for monochrome signals. The device will still equalize properly if this occurs.

Security Cameras

MegaQ™ is ideal for security camera installations.

The automatic adaptive equalizer doesn't need any active silicon on the transmit side of the cable, enabling upgrading of older installations without having to touch the installed camera base, including older monochrome cameras.

MegaQ™ automatically adjusts for wiring polarity errors as well as adjusts for optimum image quality. These features eliminates the need for the installer to make any adjustments.

With an extended equalization range of 5300ft, the ISL59605 enables cameras to be placed in even more remote locations, enabling coverage of up to three square miles from a single monitoring station.

Additional Equalization Modes Available With the Serial Interface

In addition to the **Lock Until Reset** and **Continuous Update** modes, software control of MegaQ™ through the SPI interface adds a **Lock Until Signal Loss** mode and a **Manual Equalization** mode.

Note: When controlling MegaQ™ through the SPI interface, the external FREEZE pin must be tied to ground (logic low). Failure to keep FREEZE at a logic low will prevent the software controls from working properly.

All of the equalization modes are selected via the two “Locking Mode/Manual Length Enable” register bits, 0x05[1:0].

CONTINUOUS UPDATE

Continuous Update mode is entered by setting address 0x05[1:0] = 00b. **Continuous Update** behavior is the same as described in the stand-alone mode.

LOCK UNTIL RESET

Lock Until Reset mode is entered by setting address 0x05[1:0] = 10b. **Lock Until Reset** behavior is the same as described in the stand-alone mode, with the exception of how to generate a reset.

To generate a reset via software, select **Continuous Update** mode and then return to **Lock Until Reset** mode (register 0x05[1:0] = 00b then 10b). Toggling INVERT (either the hardware pin or the software bit) will *not* cause a reset/re-equalization event.

LOCK UNTIL SIGNAL LOSS

Lock Until Signal Loss mode is entered by setting address 0x05[1:0] = 01b. **Lock Until Signal Loss** can only be enabled via the SPI interface.

In the **Lock Until Signal Loss** mode, MegaQ™ will freeze the equalization once the LOCKED pin goes high (in the same way as **Lock Until Reset**). Unlike the “Settled” state in the **Continuous Update** mode, only a signal loss lasting more than 1ms (typical) will cause MegaQ™ to re-equalize the signal when it returns. In this sense, the **Lock Until Signal Loss** mode can be considered as halfway between the **Continuous Update** mode and the **Lock Until Reset** mode. The **Lock Until Signal Loss** mode is useful, for example, when testing or demonstrating a system by plugging in multiple different length cables - it eliminates the need to also generate a reset. To prevent potentially undesired re-equalization, signal losses lasting less than 1ms (typical) do not trigger a re-equalization.

MANUAL LENGTH

Manual Length mode is entered by setting address 0x05[1:0] = 11b. **Manual Length** mode allows the forcing of specific cable lengths, cable type, DC gains, etc. (see the Register Listing on the next page). The “Cable Type” bit (0x05 [4]) allows selection between the two most common cable types for security video: Cat 5/6 or steel core RG-59 coaxial. However since many of MegaQ™’s automatic functions and adjustments are disabled in **Manual Length** mode, performance is almost always worse than what is achieved in any of the automatic modes. For example, automatic polarity correction is disabled so the polarity must be manually set using the INVERT bit. There is no practical reason to ever use **Manual Length** mode in normal operation.

Serial Interface Protocol

While MegaQ™ is designed to work as a stand-alone equalizer, it does have a serial interface that can be used to control it and monitor its state.

The serial interface is used to read and write the configuration registers. It uses three signals (SCK, SD, and SEN) for programming. The serial clock can operate up to 5MHz (5Mbits/s). The “Serial Timing Diagram” on page 8 shows the timing of serial I/O.

A transaction begins when the host microcontroller takes SEN (serial enable) high. The first 8 bits on the SD (serial data) pin are latched by MegaQ™ on the rising edge of SCK (serial clock) to form the address byte. The MSB of the address byte indicates whether the operation is a read (1) or a write (0), and the next seven bits indicate which register is to be read from or written to. Each read and write operation consists of 16 bits: 8 bits for an address byte followed by 8 bits of data. See the “Serial Timing Diagram” on page 8 for more details on using the SPI interface.

TABLE 2. ADDRESS BYTE FORMAT

| | | | | | | | |
|-----------------------|----|----|----|----|----|----|-------|
| 0 = Write 1 = Read | A6 | A5 | A4 | A3 | A2 | A1 | A0 |
| (MSB) | | | | | | | (LSB) |

WRITE OPERATION

After the address byte is clocked in, the next 8 bits should contain the data to be sent to the register identified in the address byte.

READ OPERATION

After the rising edge of the 8th clock after the address byte is clocked in, the microcontroller should tristate the SD line so MegaQ™ can begin to output data on the SD pin (from the register identified in the address byte), beginning on the 9th rising edge of SCK. The data should be latched on the *falling* edge of SCK to allow enough time for the data to settle. See “Serial Timing Diagram” on page 8 for more details on how to read from the registers.

Register Listing

| ADDRESS | REGISTER (DEFAULT VALUE) | BIT(S) | FUNCTION NAME | DESCRIPTION |
|---------|-----------------------------|--------|-------------------|--|
| 0x00 | Device ID (0x31) | 3:0 | Device Revision | 0 = initial silicon, 1 = first revision, etc. |
| | | 7:4 | Device ID | 0x3 |
| 0x01 | Signal Status (N/A) | 0 | Signal Present | 0: A signal is not present at the input 1: A signal is present at the input |
| | | 1 | DLL Locked | 0: DLL is not locked 1: DLL is locked |
| | | 2 | Signal Polarity | 0: Inverted Polarity 1: Nominal Polarity This bit is only valid if the INVERT pin is connected as an output. If INVERT is overdriven, this value may not reflect the polarity of the input signal. |
| | | 3 | Color Detected | 0: Signal is monochrome 1: Signal has a colorburst |
| | | 4 | Signal Overloaded | 0: Signal (if present) is within normal range 1: Signal appears to be overloaded |
| | | 5 | Settled | 0: EQ is not settled, though DLL may be locked. 1: EQ has stabilized and equalization achieved. |
| 0x02 | Manual Length(0x00) | 5:0 | Manual Length | Manual Length Control; 0x0 through 0x3F, 84 feet per bit. 0x0: 0 feet. 0x3F: 5300 feet (Cat 5 mode) This register sets the EQ setting when MegaQ™ is in manual length mode (reg 0x05[1:0] = 11). Note that the length in this register is for Cat 5 cable when "Cable Type" (reg 0x05[4]) equals 0. When "Cable Type" is set to 1 (coax mode), then the length is for steel core coax. In coax mode, the maximum length is 0x14 (~1200 feet) and setting the register higher than this value does not provide any increase in equalization. |

Register Listing (Continued)

| ADDRESS | REGISTER (DEFAULT VALUE) | BIT(S) | FUNCTION NAME | DESCRIPTION |
|---------|-----------------------------|--------|-----------------------------------|--|
| 0x03 | Manual DC Gain (0x20) | 5:0 | Manual DC Gain | 0x00: Maximum DC Gain (+3dB) 0x20: Mid-Scale 0dB 0x3F: Minimum DC Gain (-3dB) This register sets the DC Gain when the device is in manual length mode (reg 0x05[1:0] = 11). |
| 0x04 | Pin Overrides (0x00) | 0 | Freeze Select | 0: Use value of FREEZE pin. 1: Use value in "Freeze Value" bit |
| | | 1 | Freeze Value | If Freeze Select = 1, then: 0: Equalization is not frozen 1: Equalization is frozen at current setting. If Freeze Select = 0, then this bit is ignored. |
| | | 2 | Eq-Disable Select | 0: Use value of EQ_DISABLE pin. 1: Use value in "Eq-Disable Value" bit |
| | | 3 | Eq-Disable Value | If Eq-Disable Select = 1, then: 0: Equalizer is enabled 1: Equalizer is disabled (allows data to be sent upstream over cable pair connected to inputs) If Eq-Disable Select = 0, then this bit is ignored. |
| | | 4 | Color Select | 0: Use value of COLOR pin 1: Use value in "Color Value" bit |
| | | 5 | Color Value | If Color Select = 1, then 0: Monochrome Mode 1: Color Mode If Color Select = 0, then this bit is ignored. |
| | | 6 | Invert Select | 0: Use value of INVERT pin. 1: Use value in "Invert Value" bit |
| | | 7 | Invert Value | If Invert Select = 1, then 0: Incoming signal is not inverted 1: Incoming signal is inverted If Invert Select = 0, then this bit is ignored. |
| 0x05 | Equalization Control (0x00) | 1:0 | Locking Mode/Manual Length Enable | 00 = Continuous Monitoring 01 = Lock Until Signal Loss* 10 = Lock Until Reset 11 = Manual Length** *Signal must be missing for at least 1ms in order to trigger a re-equalization. ** In Manual Length mode the polarity corrector is disabled and the polarity must be set using the INVERT bit or pin. Note: The FREEZE pin must be tied to ground/a logic low for this function to work correctly. |
| | | 3:2 | Noise Filter | 00: No Noise Filtering 01: Min Noise Filtering 10 or 11: Max Noise Filtering Note: Noise Filtering is only available on the ISL59605 |
| | | 4 | Cable Type | 0: CAT5/6 Mode 1: Steel Core Coax Mode This bit is ignored in all modes except Manual Length (reg 0x05[1:0] = 11). Set to 1 if using copper-coated steel-core coaxial cable and you are in Manual Length . |

Bypassing and Layout Considerations

MegaQ™ requires a dedicated ground plane in order to function properly. For 2-layer boards, pour a quarter-inch ground plane extending around the device on both the top and bottom layers. Ensure that the ground plane on the bottom layer is a **solid** plane with no traces cutting through it. Bypass capacitors must be placed as close as possible to the device in order to ensure good performance at longer lengths of equalization. Ensure that the ground connections for the bypass capacitors connect **directly** to the same uniform ground plane described previously.

General PowerPAD Design Considerations

The thermal pad must be connected to the ground plane for heat dissipation. Figure 50 is an example of how to use vias to remove heat from the IC.

FIGURE 50. PCB VIA PATTERN

The thermal pad is electrically connected to GND through the high resistance IC substrate. We recommend you fill the thermal pad area with vias. The via array should be centered in the thermal pad and placed such that the center on center spacing is 3x the via radius. Vias should be small, but large enough to allow solder wicking during reflow. Connect all vias to ground. It is important the vias have a low thermal resistance for efficient heat transfer. Do not use “thermal relief” patterns. It is important to have a solid connection of the plated-through hole to each plane.

Power Dissipation

The maximum power dissipation allowed in a package is determined according to Equation 1:

$$PD_{MAX} = \frac{T_{JMAX} - T_{AMAX}}{\Theta_{JA}} \quad (EQ. 1)$$

Where:

T_{JMAX} = Maximum junction temperature

T_{AMAX} = Maximum ambient temperature

Θ_{JA} = Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power in the IC due to the load, or:

for sourcing use Equation 2:

$$PD_{MAX} = V_S \times I_{SMAX} + (V_S - V_{OUT}) \times \frac{V_{OUT}}{R_L} \quad (EQ. 2)$$

for sinking use Equation 3:

$$PD_{MAX} = V_S \times I_{SMAX} + (V_{OUT} - V_S) \times I_{LOAD} \quad (EQ. 3)$$

Where:

V_S = Supply voltage

I_{SMAX} = Maximum quiescent supply current

V_{OUT} = Maximum output voltage of the application

R_{LOAD} = Load resistance tied to ground

I_{LOAD} = Load current

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

| DATE | REVISION | CHANGE |
|-------------------|----------|--|
| August 6, 2012 | FN6739.2 | Typical applications circuit diagrams and corresponding text updated to reflect more optimal setup for the device. |
| February 4, 2011 | | Converted to Updated Intersil Template page 1 - Updated Related Literature by changing titles to match released application notes Added standard Reference to MIN and MAX columns and Note to Electrical Specifications and Serial Timing Spec Tables: "Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design." page 4 - Updated ordering information by naming Evaluation boards to match Intrepid. CHANGED I2C to SPI as follows: page 22 first paragraph and 2nd Note paragraph under "Additional Equalization Modes Available with the Serial Interface" section from "...MegaQ through the I2C interface..." to "...MegaQ through the SPI interface..." page 23 "Under Lock Until Signal Loss" section 1st paragraph last sentence "...via the I2C interface." To: "...via the SPI interface." |
| November 19, 2010 | FN6739.1 | Modified both "Typical Application" drawings on page 1 to reflect recommended new termination network. Modified Figures 45, 46, and 47 to reflect recommended new termination network. Modified text in "UTP Application Circuit" and "Coax Input Circuit" sections to mention changes to termination network. Added "Dual UTP/Coax Input Circuit" heading |
| October 21, 2010 | | Added superscript TM to all MegaQ and trademark statement, pg 1. Added ±8kV ESD protection to the Features list Pg24, Register 0x04 of the Register Listing: Fixed Select and Value locations (were swapped for each pin). Last two rows should say "Invert", not "INVERT", EXCEPT for "Use the value of INVERT pin Pg25, address 0x05 of Register listing, 3:2 Noise filter row, change from: 00: No Noise Filtering 01: Min Noise Filtering 1X: Max Noise Filtering to: 00: No Noise Filtering 01: Min Noise Filtering 10 or 11: Max Noise Filtering Note: Noise Filtering is only available on the ISL59605 |
| October 8, 2010 | FN6739.0 | Initial Release. |

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL59601](http://www.intersil.com/products/isl59601), [ISL59602](http://www.intersil.com/products/isl59602), [ISL59603](http://www.intersil.com/products/isl59603), [ISL59604](http://www.intersil.com/products/isl59604), [ISL59605](http://www.intersil.com/products/isl59605).
