

## 2.8W Stereo Class-D Audio Power Amplifier and Class AB Headphone Driver (DC Volume Control, UVP, AGC Function)

### Features

- **Operating Voltage: 3.3V-5.5V**
- **High Efficiency 85% at  $P_o=2.8W$ , 4W Speaker,  $V_{DD}=5V$**
- **Filter-Free Class-D Amplifier**
- **Low Shutdown Current**
  - $I_{DD}=1mA$  at  $V_{DD}=5V$
- **64 Steps Volume Adjustable from -80dB to +20dB by DC Voltage with Hysteresis**
- **AGC(Non-Clip) Function**
- **Under-Voltage Protection Function**
- **Output Power at THD+N=1%**
  - BTL Mode**
    - 2.25W at  $V_{DD}=5V$ ,  $R_L=4W$
    - 1.3W at  $V_{DD}=5V$ ,  $R_L=8W$
  - SE Mode**
    - 68mW at  $V_{DD}=5V$ ,  $R_L=32W$
    - Output Power at THD+N=10%**
      - 2.8W at  $V_{DD}=5V$ ,  $R_L=4W$
      - 1.6W at  $V_{DD}=5V$ ,  $R_L=8W$
- **Less External Components Required**
- **Two Output Modes Allowable with BTL and SE Modes Selected by SE/BTL Pin**
- **Thermal and Over-Current Protections with Auto-Recovery**
- **Power Enhanced Packages SSOP-24 and SSOP-24P**
- **Lead Free and Green Devices Available (RoHS Compliant)**

### General Description

The APA2606 is a stereo, high efficiency, filter-free Class-D audio amplifier available in SSOP-24 and SSOP-24P packages.

The APA2606 provides the precise DC volume control, and the gain range is from -80dB ( $V_{VOLUME}=0V$ ) to +20dB ( $V_{VOLUME}=5V$ ) with 64 steps precise control. It's easy to get the suitable amplifier's gain with the 64 steps gain setting. The filter-free architecture eliminates the output filters compared to the traditional Class-D audio amplifier, and reduces the external component counts and the components high, it could save the PCB space, system cost, simplifies the design and the power loss at filter.

APA2606 provides an AGC (Non-Clip) function, and this function can low down the dynamic range for large input signal. APA2606 can provide from 20dB to -80dB with 64 steps gain decrease for non-clipping function, and this function can avoid output signal clipping.

The APA2606 also integrates the de-pop circuitry that reduces the pops and click noises during power on/off or shutdown enable process.

The APA2606 has build-in over-current and thermal protection that prevent the chip being destroyed by short-circuit or over-temperature situation.

APA2606 combines a stereo bridge-tied loads (BTL) mode for speaker drive and a stereo single-end (SE) mode for headphone drive into a single chip, where both modes are easily switched by the SE/BTL input control pin signal.

APA2606 is capable of driving 2.8W at 5V into 4Ω speaker. The efficiency can archived 85% at  $R_L=4\Omega$  when  $P_o=2.8W$  at  $V_{DD}=5V$ .

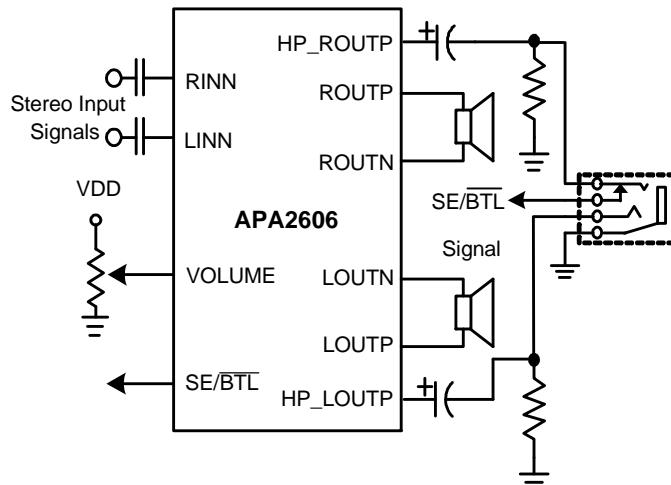

APA2606 is capable of driving 60mW at 5V into 32Ω headphone.

### Applications

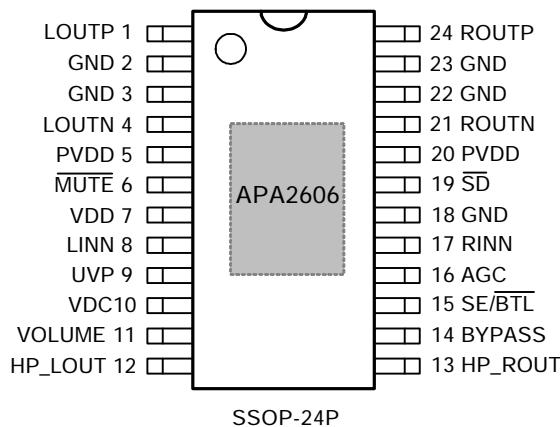

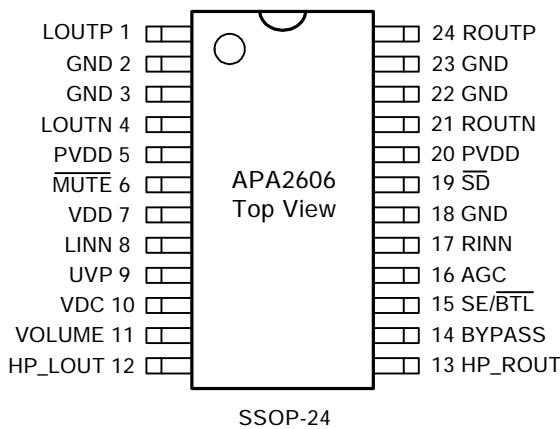

- **LCD TVs**
- **DVD Player**
- **Active Speakers**

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

## Simplified Application Circuit

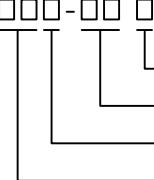

## Pin Configuration

= Thermal Pad (connected the Thermal Pad to GND plane for better dissipation)

## Ordering and Marking Information

APA2606	 Assembly Material Handling Code Temperature Range Package Code	Package Code N : SSOP-24 NA : SSOP-24P Operating Ambient Temperature Range I : -40 to 85 °C Handling Code TR : Tape & Reel Assembly Material G : Halogen and Lead Free Device
APA2606 N:	 • XXXXX	XXXXX - Date Code
APA2606 NA:	 • XXXXX	XXXXX - Date Code

Note : ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

## Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V <sub>DD</sub>	Supply Voltage (VDD, PVDD to GND)	-0.3 to 6	V
	Input Voltage (LINN, RINN to GND)	-0.3 to V <sub>DD</sub> +0.3	
	Input Voltage (SD, MUTE, AGC, UVP, VDC, VOLUME and SE/BTL, BYPASS to GND)	-0.3 to V <sub>DD</sub> +0.3	
T <sub>J</sub>	Maximum Junction Temperature	150	°C
T <sub>STG</sub>	Storage Temperature Range	-65 to +150	
T <sub>SDR</sub>	Maximum Soldering Temperature Range, 10 Seconds	260	
P <sub>D</sub>	Power Dissipation	Internally Limited	W

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
θ <sub>JA</sub>	Thermal Resistance -Junction to Ambient <sup>(Note 2)</sup> SSOP-24 SSOP-24P	96 45	°C/W
θ <sub>JC</sub>	Thermal Resistance -Junction to Case <sup>(Note 3)</sup> SSOP-24 SSOP-24P	18 11	°C/W

Note 2: Please refer to "Layout Recommendation", the GND PIN on the central of the IC should connect to the ground plane, and the PCB is a 2-layer, 5-inch square area with 2oz copper thickness.

Note 3: The case temperature is measured at the center of the GND PIN on the underside of the SSOP-24 package.

## Recommended Operating Conditions

Symbol	Parameter	Range	Unit
V <sub>DD</sub>	Supply Voltage	3.3 ~ 5.5	V

## Recommended Operating Conditions (Cont.)

Symbol	Parameter		Range	Unit
$V_{IH}$	High Level Threshold Voltage	SD, MUTE	2 ~ $V_{DD}$	V
		SE/ $\overline{BTL}$	0.8 $V_{DD}$ ~ $V_{DD}$	
$V_{IL}$	Low Level Threshold Voltage	SD, MUTE	0 ~ 0.8	V
		SE/BTL	0 ~ 1.0	
$V_{ICM}$	Common Mode Input Voltage		1 ~ $V_{DD}$ -1	V
$T_A$	Ambient Temperature Range		-40 ~ 85	°C
$T_J$	Junction Temperature Range		-40 ~ 125	
$R_L$	Speaker Resistance		3.5 ~	Ω

## Electrical Characteristics

$V_{DD}=5V$ ,  $V_{GND}=0V$ ,  $T_A= 25^\circ C$ , Gain=20dB (unless otherwise noted).

## Pin Description

PIN		I/O/P	FUNCTION
NO.	NAME		
1	LOUTP	O	Positive output of left channel power amplifier.
2, 3, 22, 23	GND	P	Power amplifier's ground.
4	LOUTN	O	Negative output of left channel power amplifier.
5,20	PVDD	P	Power amplifier's power supply.
6	MUTE	I	Mute control signal input. Place entire IC in mute mode when held low cannot float.
7	VDD	P	Control and bias block's power supply.
8	LINN	I	Negative input of left channel power amplifier.
9	UVP	I	Under-voltage protection input. Floating or pull "H" disable this function.
10	VDC	P	Volume control block's power supply.
11	VOLUME	I	Internal gain setting input.
12	HP_LOUT	O	Headphone output of left channel power amplifier.
13	HP_ROUT	O	Headphone output of right channel power amplifier.
14	BYPASS	P	Bias voltage for power amplifiers.
15	HP/BTL	I	Output mode control input, high for HP output mode and low for BTL mode cannot float.
16	AGC	I	Maximum output power setting input. When held high disable AGC function.
17	RINN	I	Negative input of right channel power amplifier.
18	GND	P	Control and bias block's ground.
19	SD	I	Shutdown mode control input. Place entire IC in shutdown mode when held low cannot float.
21	ROUTN	O	Negative output of right channel power amplifier.
24	ROUTP	O	Positive output of right channel power amplifier.

## Function Description

### Class-D Operation

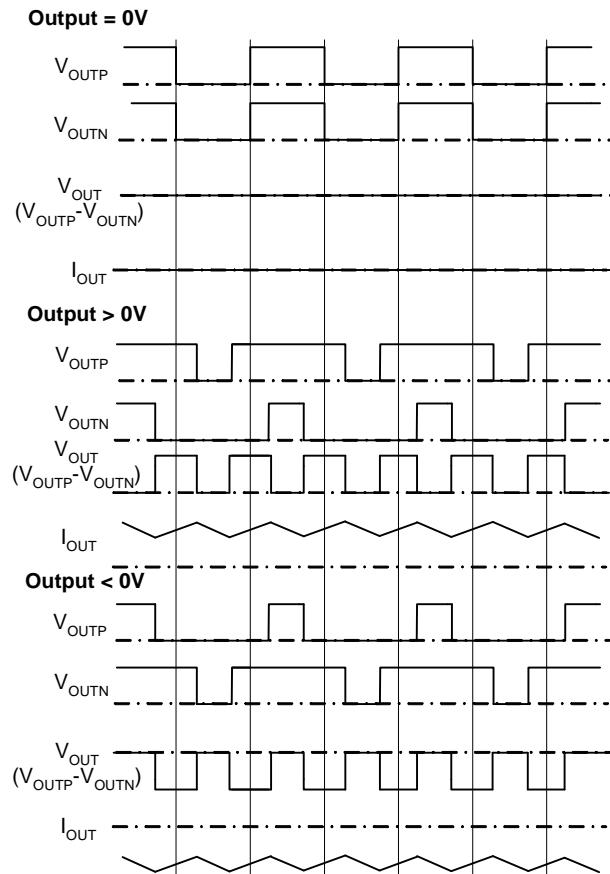

Figure1. The APA2606 Output Waveform (Voltage& Current)

The APA2606 power amplifier modulation scheme is shown in figure 1; the outputs  $V_{OUTP}$  and  $V_{OUTN}$  are in phase with each other when no input signals. When output  $> 0V$ , the duty cycle of  $V_{OUTP}$  is greater than 50% and  $V_{OUTN}$  is less than 50%; when Output  $< 0V$ , the duty cycle of  $V_{OUTP}$  is less than 50% and  $V_{OUTN}$  is greater than 50%. This method reduces the switching current across the load, and reduces the  $I^2R$  losses in the load that improve the amplifier's efficiency.

This modulation scheme has very short pulses across the load, this making the small ripple current and very little loss on the load, and the LC filter can be eliminated in most applications. Added the LC filter can increase the efficiency by filter the ripple current.

### Bypass Voltage

The bypass voltage is equal to  $V_{DD}/2$ , this voltage is for bias the internal preamplifier stages. The external capacitor for this reference ( $C_B$ ) is a critical component and serves several important functions.

### DC Volume Control Function

The APA2606 has an internal stereo volume control whose setting is the function of the DC voltage applied to the VOLUME input pin. The APA2606 volume control consists of 64 steps that are individually selected by a variable DC voltage level on the VOLUME control pin. The range of the steps controlled by the DC voltage are from +20dB to -80dB. Each gain step corresponds to a specific input voltage range, as shown in the table. To minimize the effect of noise on the volume control pin, which can affect the selected gain level, hysteresis and clock delay are implemented. The amount of hysteresis corresponds to half of the step width, as shown in the "DC Volume Control Table".

For the highest accuracy, the voltage shown in the "recommended voltage" column of the table is used to select a desired gain. This recommended voltage is exactly half-way between the two nearest transitions. The gains level have are 0.4dB/step from 20dB to 0dB; 1dB/step from 0dB to -3dB; 2dB/step from -3dB to -11dB and 6dB/step from -11dB to -41dB and the last step at -80dB as mute mode.

### AGC (Non-Clipping) Function

The APA2606 provides the 64 steps non-clipping control, and the range is from 20dB to -80dB. When the output reaches the maximum power setting value, the internal Programmable Gain Amplifier (PGA) will decrease the gain for prevent the output waveform clipping. This feature prevents speaker damage from occurring clipping. Using the AGC pin to set the non-clipping function and limit the output power.

## Function Description (Cont.)

Table 1: AGC Setting Threshold v.s Output Power

AGC Function	Output Power
VDD~0.45VDD	Disable AGC Function
0.45VDD~0.27VDD	$P_o = \frac{8(\frac{1}{2}VDD - V_{AGC})^2}{RL}$
0.27VDD~GND	(Max Output Power 4Ω) $P_o=2.513W$ (Max Output Power 8Ω) $P_o=1.26W$

### Shutdown Operation

In order to reduce power consumption while not in use, the APA2606 contains a shutdown function to externally turn off the amplifier bias circuitry. This shutdown feature turns the amplifier off when logic low is placed on the SD pin for APA2606. The trigger point between a logic high and logic low level is typically 0.65V. It is the best to switch between ground and the supply voltage  $V_{DD}$  to provide maximum device performance. By switching the SD pin to a low level, the amplifier enters a low-consumption-current state,  $I_{DD}$  for APA2606 is in shutdown mode. On normal operating, APA2606's SD pin should pull to a high level to keep the IC out of the shutdown mode. The SD pin should be tied to a definite voltage to avoid unwanted state changes.

### Over-Current Protection

The APA2606 monitors the output current, and when the current exceeds the current-limit threshold, the APA2606 turn-off the output stage to prevent the output device from damages in over-current or short-circuit condition. The IC will turn-on the output buffer after 1ms, but if the over-current or short-circuits condition is still remain, it enters the over-current protection again. The situation will circulate until the over-current or short-circuits has be removed.

### Thermal Protection

The over-temperature circuit limits the junction temperature of the APA2606. When the junction temperature exceeds  $T_J=+150^{\circ}\text{C}$ , a thermal sensor turns off the output buffer, allowing the devices to cool. The thermal sensor allows the amplifier to start-up after the junction temperature down about  $125^{\circ}\text{C}$ . The thermal protection is designed with a  $25^{\circ}\text{C}$  hysteresis to lower the average  $T_J$  during continuous thermal overload conditions, increasing lifetime of the IC.

### Under-Voltage Protection

External under voltage detection can be used to shutdown the APA2606 before an input device can generate a pop. The shutdown threshold at the UVP pin is 1.2V. The user selects a resistor divider to obtain the shutdown threshold and hysteresis for the specific application. The thresholds can be determined as below:

$$\text{VUVP}=[1.2-(I_{\text{Hys}}+\text{initial})xR3](R1+R2)/R2$$

$$\text{Hysteresis}=I_{\text{Hys}} \times R3 \times (R1+R2)/R2$$

$$I_{\text{Hys}}=4.6\mu\text{A}(\text{typ})$$

$$\text{initial}=1.1\mu\text{A}(\text{typ})$$

IC will shutdown when  $V_{\text{system}}$  voltage is lower than  $\text{VUVP}$ .

IC will release when  $V_{\text{system}}$  voltage is above than  $\text{VUVP}+\text{Hysteresis}$ .

With the condition:  $R3 \gg R1//R2$

For example, to obtain  $\text{VUVP}=3.7\text{V}$  and  $0.9\text{V}$  hysteresis,  $R1=3k\Omega$ ,  $R2=1k\Omega$  and  $R3=50k\Omega$ .

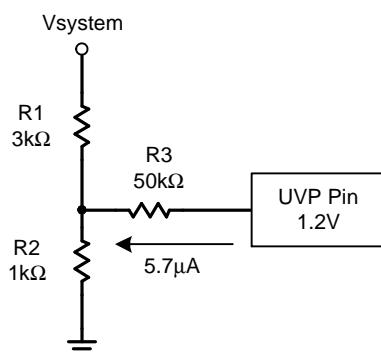

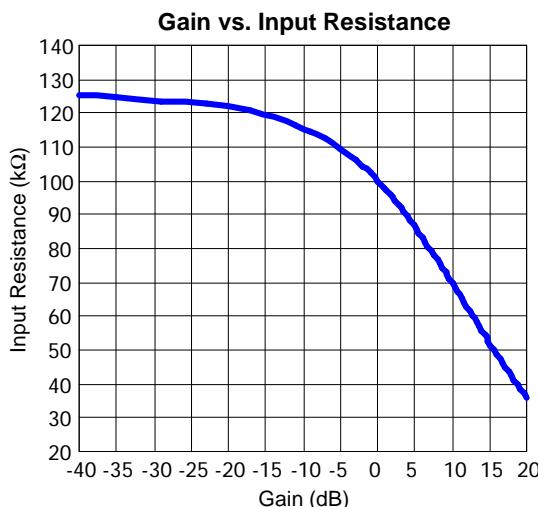

Figure 2. Under-Voltage Protection

## Application Information

### Square Wave into the Speaker

Apply the square wave into the speaker may cause the voice coil of speaker jumping out the air gap and defacing the voice coil. However, this depends on the amplitude of square wave is high enough and the bandwidth of speaker is higher than the square wave's frequency. For 500kHz switching frequency, this is not issued for the speaker because the frequency is beyond the audio band and can't significantly move the voice coil, as cone movement is proportional to  $1/f^2$  for frequency out of audio band.

### Input Resistor, $R_i$

For achieving the 64 steps gain setting, it varies the input resistance network ( $R_i$  &  $R_f$ ) of amplifier. The input resistor's range form smallest to maximum is about six times. Therefore, the input high-pass filter's low cutoff frequency will change six times from low to high. The cutoff frequency can be calculated by equation 1.

### Input Capacitor, $C_i$

In the typical application, an input capacitor,  $C_i$ , is required to allow the amplifier to bias the input signal to the proper DC level for optimum operation. In this case,  $C_i$  and the input impedance  $R_i$  form a high-pass filter with the corner frequency determined in the following equation:

$$f_{C(\text{highpass})} = \frac{1}{2\pi R_i C_i} \quad (1)$$

The value of  $C_i$  must be considered carefully because it directly affects the low frequency performance of the circuit. Where  $R_i$  is 36kΩ (minimum) and the specification calls for a flat bass response down to 50Hz. The equation is reconfigured as below:

$$C_i = \frac{1}{2\pi R_i f_c} \quad (2)$$

When the input resistance variation is considered, the  $C_i$  is 0.08μF, so a value in the range of 0.01μF to 0.022μF would be chosen. A further consideration for this capacitor is the leakage path from the input source through the input network ( $R_i + R_f, C_i$ ) to the load. This leakage current creates a DC offset voltage at the input to the amplifier that reduces useful headroom, especially in high gain applications. For this reason, a low-leakage tantalum or ceramic capacitor is the best choice. When polarized capacitors are used, the positive side of the capacitor should face the amplifiers' input in most applications because the DC level of the amplifiers' inputs are held at  $V_{DD}/2$ . Please note that it is important to confirm the capacitor polarity in the application.

### Effective Bypass Capacitor, $C_B$

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection.

The bypass capacitance affects the startup time. It is determined in the following equation:

$$T_{\text{START-UP}} = 0.5(\text{sec}/\mu\text{F}) \times C_B + 0.2(\text{sec}) \quad (3)$$

The capacitor location on the bypass pin should be as close to the device as possible. The effect of a larger half bypass capacitor is improved PSRR due to increased half-supply stability. The selection of bypass capacitors, especially  $C_B$ , is thus dependent upon desired PSRR requirements, click and pop performance. To avoid the start-up pop noise occurred, choose  $C_i$  which is not larger than  $C_B$ .

## Application Information (Cont.)

### Ferrite Bead Selection

If the traces from APA2606 to speaker are short, the ferrite bead filters can reduce the high frequency radiated to meet the FCC & CE required.

A ferrite that has very low impedance at low frequencies and high impedance at high frequencies (above 1 MHz) is recommended.

### Output Low-Pass Filter

If the traces from APA2606 to speaker are short, it doesn't require output filter for FCC & CE standard.

A ferrite bead may be needed if it's failing the test for FCC or CE tested without the LC filter. The figure 3 is the sample for added ferrite bead; the ferrite shows choosing high impedance in high frequency.

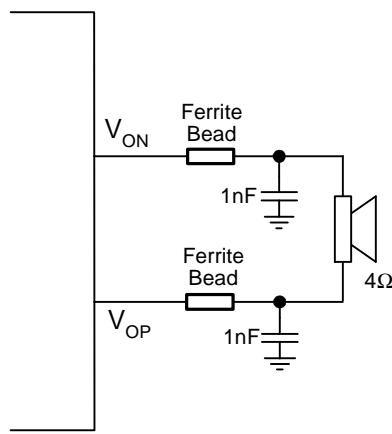

Figure 3. Ferrite bead output filter

Figure 4 and 5 are examples for added the LC filter (Butterworth), it's recommended for the situation that the trace from amplifier to speaker is too long and needs to eliminate the radiated emission or EMI.

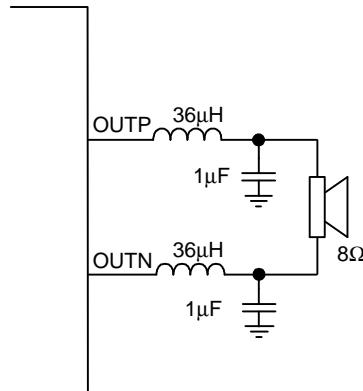

Figure 4. LC output filter for 8Ω speaker

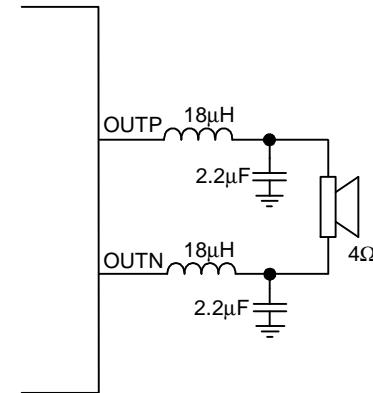

Figure 5. LC output filter for 4Ω speaker

Figure 4 and 5's low pass filter cut-off frequency are 25kHz ( $F_C$ ).

$$f_{C(\text{lowpass})} = \frac{1}{2\pi\sqrt{LC}} \quad (5)$$

### Power-Supply Decoupling Capacitor, $C_s$

The APA2606 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure the output total harmonic distortion (THD) is as low as possible. Power supply decoupling also prevents the oscillations being caused by long lead length between the amplifier and the speaker.

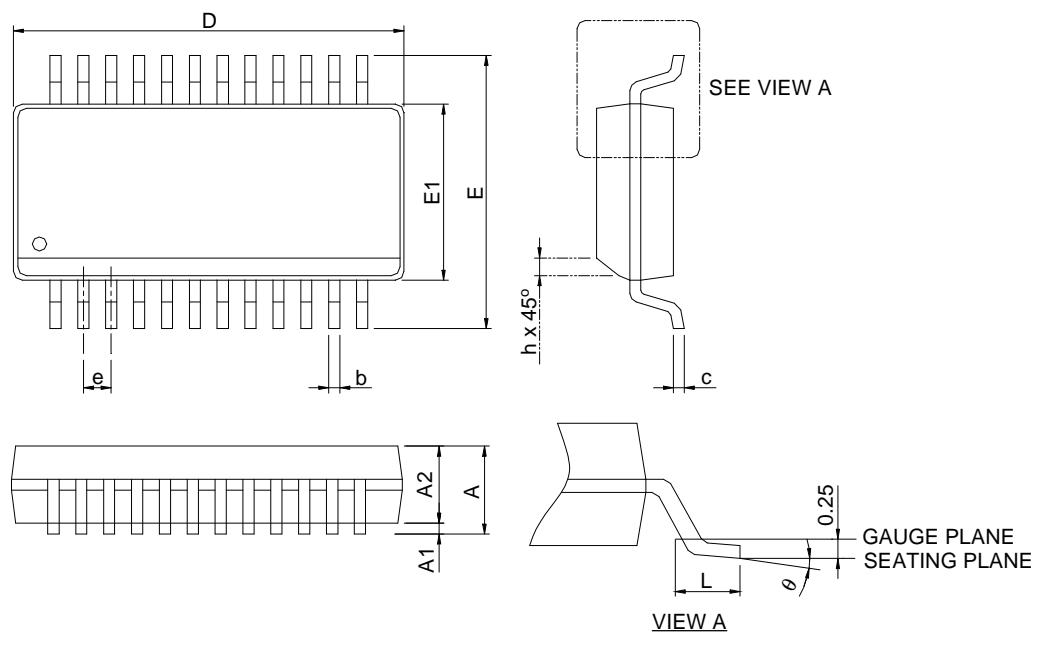

## Application Information (Cont.)

### Power-Supply Decoupling Capacitor, $C_s$ (Cont.)

The optimum decoupling is achieved by using two different types of capacitors that target on different types of noise on the power supply leads. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically  $0.1\mu F$  placed as close as possible to the device VDD pin for works best. For filtering lower frequency noise signals, a large aluminum electrolytic capacitor of  $10\mu F$  or greater placed near the audio power amplifier is recommended.
