## General Description

The TriQuint TGF2954 is a discrete 5.04 mm GaN on SiC HEMT which operates from DC-12 GHz. The TGF2954 is designed using TriQuint's proven TQGaN25 production process. This process features advanced field plate techniques to optimize microwave power and efficiency at high drain bias operating conditions.

The TGF2954 typically provides 44.5 dBm of saturated output power with power gain of 19.5 dB at 3 GHz. The maximum power added efficiency is 71.5 % which makes the TGF2954 appropriate for high efficiency applications.

Lead-free and RoHS compliant.

## Assembly Notes

Component placement and adhesive attachment assembly notes:

- Vacuum pencils and/or vacuum collets are the preferred method of pick up.
- Air bridges must be avoided during placement.
- The force impact is critical during auto placement.
- Organic attachment (i.e. epoxy) not recommended.

Reflow process assembly notes:

- Use AuSn (80/20) solder and limit exposure to temperatures above 300°C to 3-4 minutes, maximum.
- An alloy station or conveyor furnace with reducing atmosphere should be used.
- Do not use any kind of flux.
- Coefficient of thermal expansion matching is critical for long-term reliability.
- Devices must be stored in a dry nitrogen atmosphere.

Interconnect process assembly notes:

- Ball bonding is the preferred interconnect technique, except where noted on the assembly diagram.
- Force, time, and ultrasonics are critical bonding parameters.
- Aluminum wire should not be used.
- Devices with small pad sizes should be bonded with 0.0007-inch wire.

## Disclaimer

GaN/SiC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

## Bias-up Procedure

1.  $V_G$  set to -5 V.
2.  $V_D$  set to 32 V.
3. Adjust  $V_G$  more positive until quiescent  $I_D$  is 100 mA.
4. Apply RF signal.

## Bias-down Procedure

1. Turn off RF signal.
2. Turn off  $V_D$  and wait 1 second to allow drain capacitor dissipation.
3. Turn off  $V_G$ .
