System Reset (with built-in watchdog timer)

Monolithic IC MM1095

Outline

This IC functions in a variety of CPU systems and other logic systems to generate a reset signal and reset the system accurately during momentary interruption or lowering of power supply voltage.

It also has a built-in watchdog timer for operation diagnosis. This prevents the system from running wild by generating an intermittent reset pulse during system mis-operation.

Features

- 1. Built-in watchdog timer
- 2. Low minimum operating voltage
- 3. Low operating limit voltage
- 4. Watchdog stop function (RCT pin)
- 5. Few external parts

100μA typ.

Vcc=0.8V

Package

DIP-8B (MM1095AD, MM1095BD)

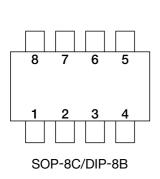

SOP-8C (MM1095AF, MM1095BF)

SIP-8A (MM1095AS, MM1095BS)

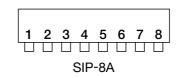

Applications

- 1. Reset circuits in microcomputers, CPUs and MPUs
- 2. Logic circuit reset circuits
- 3. Microcomputer system monitoring, etc.

Pin Description

Pin No.	Name	Function								
		Twd, Twr, Tpr variable pins	T _{PR} (ms)=5000 Χ C _T (μF)							
1	TC	(Twd, Twr and Tpr times are determined	Twd (ms)=500 \times CT (μ F)							
		by the external capacitor.)	Twr (ms)= $100 \times C_T (\mu F)$							
2	N.C									
3	CK	Clock input pin, inputs clock from logic system								
4	GND	GND pin								
5	Vcc	Voltage detection $MM1095A \rightarrow 3.2V$, $MM1095B \rightarrow 4.2V$								
6	RCT	Watchdog timer stop pin Operation modes : Operation → OPEN, Stop → connect to GND								
7	Vs	Detection voltage variable pin								
8	RESET	Reset output pin (low output)								

Absolute Maximum Ratings

Item	Symbol	Rating	Units
Power supply voltage	Vcc max.	-0.3~+10	V
CK pin input voltage	Vck	-0.3~Vcc+0.3 (≤+10)	V
Vs pin input voltage	Vvs	-0.3~Vcc+0.3 (≤+10)	V
Voltage applied to RCT pin	Vrct	-0.3~Vcc+0.3 (≤+10)	V
Voltage applied to RESET pin	Voh	-0.3~Vcc+0.3 (≤+10)	V
Allowable loss	Pd	400	mW
Storage temperature	Tstg	-40~+125	°C

Recommended Operating Conditions

Item	Symbol	Rating	Units
Power supply voltage	Vcc	+2.2~+7.0	V
RESET sync current	Iol	0~1.0	mA
Clock monitoring time setting	Twd	0.1~1000	ms
Clock rise and fall times	trc, trc	<100	μs
TC pin capacitance	Ст	0.0002~2	μF
Operating temperature	Тор	-25~+75	°C

Electrical Characteristics (DC) (Except where noted otherwise, MM1095A: Vcc=3.6V, Ta = 25°C, MM1095B: Vcc=5.0V)

Notes:

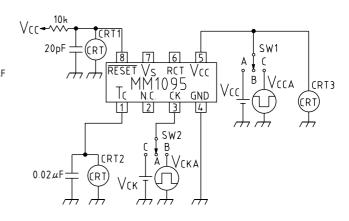

- *1 Monitoring time is the time from the last pulse (negative edge) of the timer clear clock pulse until reset pulse output. In other words, reset output is output if a clock pulse is not input during this time.
- *2 Reset time means reset pulse width. However, this does not apply to power ON reset.
- *3 Reset hold time is the time from when Vcc exceeds detection voltage (VsH) during power ON reset until reset release (RESET output high).
- *4 Output delay time is the time from when power supply voltage drops below detection voltage (VsL) until reset (RESEToutput low).
- *5 Voltage range when measuring output rise and fall is 10~90%.
- *6 Watchdog timer monitoring time (TwD), watchdog timer reset time (TwR) and reset hold time (TPR) during power supply rise can be changed by varying C⊤ capacitance. The times are expressed by the following formulae.

The (ms) $= 5000 \times C_T (\mu F)$ Two (ms) $= 500 \times C_T (\mu F)$ Twr (ms) $= 100 \times C_T (\mu F)$ Example: When $C_T=0.02\mu F$ The = 100msTwo = 10msTwo = 2ms

Block Diagram

	RA	Rв
MM1095A	≃305k	≃ 195k
MM1095B	≃350k	≃ 150k

Note 1 : $C_P=0.1\mu F$ approx.

Note 2 : C ≥ 1000pF

Note 3: The watchdog timer can be stopped by connecting the RCT pin to GND. (Then it functions as a voltage detection circuit.)

Timing Chart

Description of Operation

- 1. RESET goes low when Vcc rises to approximately 0.8V.
- 2. Capacitor C_T charging starts when Vcc rises to VsH (MM1095A ≒ 3.25V, MM1095B ≒ 4.3V). Output is in reset state at this time.
- 3. Output reset is released (RESET goes high) after a certain time (T_{PR}), from when C_T starts charging until discharge (the time from when C_T voltage reaches a certain threshold value 1 (= 1.4V) until C_T voltage drops to a certain threshold value 2 (= 0.2V). Approximately 1μA (Vcc=0.8V) of pull up current is output from RESET.

Reset hold time: TPR is as follows.

TPR (ms) $= 5000 \times CT (\mu F)$

C_T charging starts again after reset release, and watchdog timer operation begins.

- 4. If a clock is input (negative edge trigger) to the CK pin during C_T charging, charging switches to discharge.
- 5. Discharge switches to charging when C_T voltage drops to a certain threshold value (≒ 0.2V). Steps 4 and 5 are repeated while a normal clock is input from the logic system.
- 6. Output goes to reset state (RESET goes low) when the clock ceases and C_T voltage reaches reset ON threshold value (≒ 1.4V).

The formula for C_T charging time (TwD: watchdog timer monitoring time) until reset is output is as follows. TwD (ms) $= 500 \times C_T$ (μF)

7. Watchdog timer reset time TwR is the discharge time until C⊤ voltage drops to reset OFF threshold value (≒ 0.2V). The formula is as follows.

Twr (ms) $= 100 \times CT (\mu F)$

After reset OFF threshold value is reached, output reset is released and C_T starts charging. Thereafter, steps 4 and 5 are repeated if a normal clock is input, and when the clock ceases, 6 and 7 are repeated.

- 8. Reset is output when Vcc drops to VsL (MM1095A ≒ 3.2V, MM1095B ≒ 4.2V). C⊤ is charged simultaneously.
- 9. CT charging starts when Vcc rises to Vsh.
 - When Vcc drops momentarily, C_T charging begins after the charge is first discharged, if the time from Vcc dropping below VsL until it rises to VsH is longer than the Vcc input pulse width standard value TPL.
- 10.Output reset is released after Vcc goes above VsH and after TpR, and the watchdog timer starts. Thereafter, 8~10 are repeated when Vcc goes below VsL.
- 11. When power is OFF, reset is output if Vcc goes below Vsl.
- 12. When Vcc drops to 0V, reset output is held until Vcc reaches 0.8V.
