## DATA SHEET

74LVC245A; 74LVCH245A
Octal bus transceiver with direction pin with 5 Volt tolerant input/outputs (3-state)

Product specification
Supersedes data of 1997 Dec 19

## Octal bus transceiver with direction pin with 5 Volt tolerant input/outputs (3-state)

 74LVC245A;
## FEATURES

- 5 V tolerant inputs/outputs for interfacing with 5 V logic
- Wide supply voltage range from 1.2 to 3.6 V
- CMOS low power consumption
- Direct interface with TTL levels
- Inputs accept voltages up to 5.5 V
- Complies with JEDEC standard no. 8-1A
- High-imp
edance when $\mathrm{V}_{\mathrm{CC}}=0 \mathrm{~V}$
- Bushold on all data inputs (74LVCH245A only)
- Specified from -40 to $+85^{\circ} \mathrm{C}$ and -40 to $+125^{\circ} \mathrm{C}$.

## DESCRIPTION

The 74LVC245A/74LVCH245A is a high-performance, low-power, low-voltage, Si-gate CMOS device, superior to most advanced CMOS compatible TTL families.

Inputs can be driven from either 3.3 or 5 V devices. In 3-state operation outputs can handle 5 V . These features allow the use of these devices as translators in a mixed 3.3 and 5 V environment.

The 74LVC245A/74LVCH245A is an octal transceiver with non-inverting 3 -state bus compatible outputs in both send and receive directions.

The 74LVC245A/74LVCH245A has an output enable (OE) input for easy cascading and a send/receive (DIR) input for direction control. $\overline{\mathrm{OE}}$ controls the outputs so that the buses are effectively isolated.

## QUICK REFERENCE DATA

GND $=0 \mathrm{~V} ; \mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C} ; \mathrm{t}_{\mathrm{r}}=\mathrm{t}_{\mathrm{f}} \leq 2.5 \mathrm{~ns}$.

| SYMBOL | PARAMETER | CONDITIONS | TYPICAL | UNIT |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{t}_{\text {PHL }} / \mathrm{t}_{\text {PLH }}$ | propagation delay $\mathrm{A}_{\mathrm{n}}$ to $\mathrm{B}_{\mathrm{n}}, \mathrm{B}_{\mathrm{n}}$ to $\mathrm{A}_{\mathrm{n}}$ | $\mathrm{C}_{\mathrm{L}}=50 \mathrm{pF} ; \mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}$ | 2.9 | ns |
| $\mathrm{C}_{\mathrm{I}}$ | input capacitance |  | 4.0 | pF |
| $\mathrm{C}_{\text {I/O }}$ | input/output capacitance |  | 10.0 | pF |
| $\mathrm{C}_{\text {PD }}$ | power dissipation capacitance per buffer | $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V} ;$ notes 1 and 2 | 15 | pF |

## Notes

1. $C_{P D}$ is used to determine the dynamic power dissipation $\left(P_{D}\right.$ in $\left.\mu W\right)$.
$P_{D}=C_{P D} \times V_{C C}{ }^{2} \times f_{i}+\Sigma\left(C_{L} \times V_{C C}{ }^{2} \times f_{o}\right)$ where:
$\mathrm{f}_{\mathrm{i}}=$ input frequency in MHz ;
$\mathrm{f}_{\mathrm{o}}=$ output frequency in MHz ;
$\mathrm{C}_{\mathrm{L}}$ = output load capacitance in pF ;
$\mathrm{V}_{\mathrm{CC}}=$ supply voltage in Volts;
$\Sigma\left(C_{L} \times V_{C C}{ }^{2} \times f_{0}\right)=$ sum of the outputs.
2. The condition is $\mathrm{V}_{\mathrm{I}}=\mathrm{GND}$ to $\mathrm{V}_{\mathrm{Cc}}$.

Octal bus transceiver with direction pin with 5 Volt tolerant input/outputs (3-state)

## ORDERING INFORMATION

| TYPE NUMBER | TEMPERATURE RANGE | PACKAGE |  |  |  |

## Notes

1. All typical values are measured at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}$ and $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$.
2. For bushold parts, the bushold circuit is switched off when $\mathrm{V}_{1}>\mathrm{V}_{\mathrm{CC}}$ allowing 5.5 V on the input terminal.
3. For I/O ports the parameter $\mathrm{I}_{\mathrm{OZ}}$ includes the input leakage current.
4. Valid for data inputs of bushold parts (LVCH) only.
5. For data inputs only, control inputs do not have a bushold circuit.
6. The specified sustaining current at the data input holds the input below the specified $\mathrm{V}_{\text {}}$ level.
7. The specified overdrive current at the data input forces the data input to the opposite logic input state.

## SOLDERING

## Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

## Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.
Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.
Typical reflow peak temperatures range from
215 to $250^{\circ} \mathrm{C}$. The top-surface temperature of the packages should preferable be kept below $220^{\circ} \mathrm{C}$ for thick/large packages, and below $235^{\circ} \mathrm{C}$ for small/thin packages.

## Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
- larger than or equal to 1.27 mm , the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed-circuit board;
- smaller than 1.27 mm , the footprint longitudinal axis must be parallel to the transport direction of the printed-circuit board.
The footprint must incorporate solder thieves at the downstream end.
- For packages with leads on four sides, the footprint must be placed at a $45^{\circ}$ angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at $250^{\circ} \mathrm{C}$.
A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

## Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage ( 24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to $300^{\circ} \mathrm{C}$.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and $320^{\circ} \mathrm{C}$.

Suitability of surface mount IC packages for wave and reflow soldering methods

| PACKAGE ${ }^{(1)}$ | SOLDERING METHOD |  |
| :--- | :--- | :--- |
|  | WAVE | REFLOW |

## Notes

1. For more detailed information on the BGA packages refer to the "(LF)BGA Application Note" (AN01026); order a copy from your Philips Semiconductors sales office.
2. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
3. These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
4. If wave soldering is considered, then the package must be placed at a $45^{\circ}$ angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
5. Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm .
6. Wave soldering is suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm .

## DATA SHEET STATUS

| DATA SHEET STATUS ${ }^{(1)}$ | PRODUCT <br> STATUS |  |
| :--- | :--- | :--- |
| Objective data | Development | DEFINITIONS |
| Preliminary data | This data sheet contains data from the objective specification for product <br> development. Philips Semiconductors reserves the right to change the <br> specification in any manner without notice. |  |
| Qualification | This data sheet contains data from the preliminary specification. <br> Supplementary data will be published at a later date. Philips <br> Semiconductors reserves the right to change the specification without <br> notice, in order to improve the design and supply the best possible <br> product. |  |
|  | Production | This data sheet contains data from the product specification. Philips <br> Semiconductors reserves the right to make changes at any time in order <br> to improve the design, manufacturing and supply. Changes will be <br> communicated according to the Customer Product/Process Change <br> Notification (CPCN) procedure SNW-SQ-650A. |

## Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL http://www.semiconductors.philips.com.

## DEFINITIONS

Short-form specification - The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition - Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.
Application information - Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## DISCLAIMERS

Life support applications - These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.
Right to make changes - Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
