**CMOS Quad SPST Analog Switch**

The DG201 solid state analog switch is designed using an improved, high voltage CMOS monolithic technology. It provides ease-of-use and performance advantages not previously available from solid state switches. Destructive latch-up of solid state analog gates have been eliminated by Intersil's CMOS technology.

The DG201 is completely specification and pinout compatible with the industry standard devices.

**Features**

- Switches Greater than 28V<sub>P-P</sub> Signals with ±15V Supplies
- Break-Before-Make Switching
  - t<sub>OFF</sub> ..... 250ns
  - t<sub>ON</sub> ..... 700ns
- TTL, DTL, CMOS, PMOS Compatible
- Non-Latching with Supply Turn-Off
- Complete Monolithic Construction
- Industry Standard (DG201)

**Applications**

- Data Acquisition
- Sample and Hold Circuits
- Operational Amplifier Gain Switching Networks

NOTES:

2. Typical values are for design aid only, not guaranteed and not subject to production testing.
3. All channels are turned off by high “1” logic inputs and all channels are turned on by low “0” inputs; however 0.8V to 2.4V describes the minimum range for switching properly. Peak input current required for transition is typically -120 $\mu\text{A}$ .

**Typical Applications**

**Using the  $V_{REF}$  Terminal**

The DG201 has an internal voltage divider setting the TTL threshold on the input control lines for  $V+$  equal to +15V. The schematic shown in Figure 4 with nominal resistor values, gives approximately 2.4V on the  $V_{REF}$  pin. As the TTL input signal goes from +0.8V to +2.4V,  $Q_1$  and  $Q_2$  switch states to turn the switch ON and OFF. If the power supply voltage is less than +15V, then a resistor ( $R_{EXT}$ ) must be added between  $V+$  and the  $V_{REF}$  pin, to restore +2.4V at  $V_{REF}$ . The table shows the value of this resistor for various supply voltages, to maintain TTL compatibility. If CMOS logic levels with a +5V supply are being used, the threshold shifts are less critical, but a separate column of suitable values is given in the table. For logic swings of -5V to + 5V, no resistor is needed.

FIGURE 4.

In general, the “low” logic level should be <0.8V to prevent  $Q_1$  and  $Q_2$  from both being ON together (this will cause incorrect switch function).

NOTES:

- Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
- Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
- D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
- E and  $e_A$  are measured with the leads constrained to be perpendicular to datum  $-C-$ .
- $e_B$  and  $e_C$  are measured at the lead tips with the leads unconstrained.  $e_C$  must be zero or greater.
- B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
- N is the maximum number of terminal positions.
- Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).
