Notes

- NC pins are not connected on the die.
- The BYTE pin in the 48-TSOP I package must be tied to V_{CC} to use the device as a 1M X 16 SRAM. The 48-TSOP I package can also be used as a 2M X 8 SRAM by tying the BYTE signal to V_{SS}. In the 2M x 8 configuration, pin 45 is A20, while BHE, BLE and IO₈ to IO₁₄ pins are not used.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC}(typ), T_A = 25°C.

Notes

- V_{IL(min)} = -2.0V for pulse durations less than 20 ns.
- V_{IH(max)} = V_{CC} + 0.75V for pulse durations less than 20 ns.
- Full Device AC operation is based on a 100 μs ramp time from 0 to V_{CC} (min) and 200 μs wait time after V_{CC} stabilization.
- Under DC conditions the device meets a V_{IL} of 0.8V. However, in dynamic conditions Input LOW Voltage applied to the device must not be higher than 0.7V.
- Only chip enables (\overline{CE}_1 and CE₂), byte enables (\overline{BHE} and \overline{BLE}) and \overline{BYTE} need to be tied to CMOS levels to meet the I_{SB2} / I_{CDDR} spec. Other inputs can be left floating.
- Tested initially and after any design or process changes that may affect these parameters.

- 12. BHE, BLE is the AND of BHE and BLE. Deselect the chip by either disabling the chip enable signals or by disabling BHE and BLE.

Notes

13. Test conditions for all parameters other than tri-state parameters assume signal transition time of 1 V/ns, timing reference levels of $V_{CC}(typ)/2$, input pulse levels of 0 to $V_{CC}(typ)$, and output loading of the specified I_{OL}/I_{OH} as shown in "AC Test Loads and Waveforms" on page 4.
14. AC timing parameters are subject to byte enable signals (BHE or BLE) not switching when chip is disabled. See application note AN13842 for further clarification.
15. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
16. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
17. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} or \overline{BLE} or both = V_{IL} , and $CE_2 = V_{IH}$. All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

Notes

- 18. The device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} , \overline{BLE} or both = V_{IL} , and $CE_2 = V_{IH}$.
- 19. \overline{WE} is HIGH for read cycle.
- 20. Address valid before or similar to \overline{CE}_1 , \overline{BHE} , \overline{BLE} transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)

Notes

21. Data IO is high impedance if $\overline{OE} = V_{IH}$.

22. If \overline{CE}_1 goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

23. During this period the IOs are in output state and input signals must not be applied.
