**Input/Output Functional Description**

Symbol	Type	Polarity	Pin Description
CK0	IN	Positive Edge	Positive line of the differential pair of system clock inputs that drives input to the on-DIMM PLL.
$\overline{CK0}$	IN	Negative Edge	Negative line of the differential pair of system clock inputs that drives input to the on-DIMM PLL.
CKE[1:0]	IN	Active High	Activates the DDR2 SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{S}$ [1:0]	IN	Active Low	Enables the associated DDR2 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by S0; Rank 1 is selected by S1
ODT[1:0]	IN	Active High	On-Die Termination signals.
$\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$	IN	Active Low	When sampled at the positive rising edge of the clock. $\overline{RAS}$ , $\overline{CAS}$ and $\overline{WE}$ (ALONG WITH S) define the command being entered.
Vref	Supply		Reference voltage for SSTL18 inputs
V <sub>DDQ</sub>	Supply		Power supplies for the DDR2 SDRAM output buffers to provide improved noise immunity. For all current DDR2 unbuffered DIMM designs, V <sub>DDQ</sub> shares the same power plane as V <sub>DD</sub> pins.
BA[2:0]	IN	-	Selects which DDR2 SDRAM internal bank of Eight is activated.
A[9:0], A10/AP A[13:11]	IN	-	During a Bank Activate command cycle, Address input defines the row address (RA0~RA13)  During a Read or Write command cycle, Address input defines the column address when sampled at the cross point of the rising edge of CK and falling edge of CK. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge.
DQ[63:0], CB[7:0]	IN	-	Data and Check Bit Input/Output pins.
DM[8:0]	IN	Active High	DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
V <sub>DD</sub> , V <sub>SS</sub>	Supply		Power and ground for the DDR2 SDRAM input buffers, and core logic. V <sub>DD</sub> and V <sub>DDQ</sub> pins are tied to V <sub>DD</sub> /V <sub>DDQ</sub> planes on these modules.
DQS[17:0]	I/O	Positive Edge	Positive line of the differential data strobe for input and output data
$\overline{DQS}$ [17:0]	I/O	Negative Edge	Negative line of the differential data strobe for input and output data
SA[2:0]	IN	-	These signals are tied at the system planar to either V <sub>SS</sub> or V <sub>DDSPD</sub> to configure the serial SPD EEPROM address range.
SDA	I/O	-	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM. A resistor may be connected from the SDA bus line to V <sub>DDSPD</sub> on the system planar to act as a pull up.
SCL	IN	-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from SCL to V <sub>DDSPD</sub> to act as a pull up on the system board.
VDDSPD	Supply		Power supply for SPD EEPROM. This supply is separate from the VDD/VDDQ power plane. EEPROM supply is operable from 1.7V to 3.6V.
RESET	IN		The RESET pin is connected to the RST pin on the register and to the OE pin on the PLL. When low, all register outputs will be driven low and the PLL clocks to the DRAMs and register(s) will be set to low level (the PLL will remain synchronized with the input clock)
Par_In	IN		Parity bit for the Address and Control bus ("1". Odd, "0". Even)
Err_Out	OUT		Parity error found in the Address and Control bus
TEST			Used by memory bus analysis tools (unused on memory DIMMs)

### OUTPUT DC CURRENT DRIVE

Symbol	Parameter	SSTL_18	Units	Notes
$I_{OH(dc)}$	Output Minimum Source DC Current	- 13.4	mA	1, 3, 4
$I_{OL(dc)}$	Output Minimum Sink DC Current	13.4	mA	2, 3, 4

**Note:**

1.  $V_{DDQ} = 1.7$  V;  $V_{OUT} = 1420$  mV.  $(V_{OUT} - V_{DDQ})/I_{OH}$  must be less than 21 ohm for values of  $V_{OUT}$  between  $V_{DDQ}$  and  $V_{DDQ} - 280$  mV.
2.  $V_{DDQ} = 1.7$  V;  $V_{OUT} = 280$  mV.  $V_{OUT}/I_{OL}$  must be less than 21 ohm for values of  $V_{OUT}$  between 0 V and 280 mV.
3. The dc value of  $V_{REF}$  applied to the receiving device is set to  $V_{TT}$
4. The values of  $I_{OH(dc)}$  and  $I_{OL(dc)}$  are based on the conditions given in Notes 1 and 2. They are used to test device drive current capability to ensure  $V_{IH}$  min plus a noise margin and  $V_{IL}$  max minus a noise margin are delivered to an SSTL\_18 receiver. The actual current values are derived by shifting the desired driver operating point along a 21 ohm load line to define a convenient driver current for measurement.

### Note:

1. IDD specifications are tested after the device is properly initialized
2. Input slew rate is specified by AC Parametric Test Condition
3. IDD parameters are specified with ODT disabled.
4. Data bus consists of DQ, DM, DQS,  $\overline{DQS}$ , RDQS,  $\overline{RDQS}$ , LDQS,  $\overline{LDQS}$ , UDQS, and  $\overline{UDQS}$ . IDD values must be met with all combinations of EMRS bits 10 and 11.
5. Definitions for IDD
  - LOW is defined as  $V_{in} \leq V_{ILAC}(\text{max})$
  - HIGH is defined as  $V_{in} \geq V_{IHAC}(\text{min})$
  - STABLE is defined as inputs stable at a HIGH or LOW level
  - FLOATING is defined as inputs at  $V_{REF} = V_{DDQ}/2$
  - SWITCHING is defined as: inputs changing between HIGH and LOW every other clock cycle (once per two clocks) for address and control signals, and inputs changing between HIGH and LOW every other data transfer (once per clock) for DQ signals not including masks or strobes
