

VCC4 series

1.8, 2.5, 3.3, 5.0 volt CMOS Oscillator

The VCC4 Crystal Oscillator

Features

- CMOS output
- Output frequencies to 125 MHz
- Low jitter, Fundamental or 3rd OT Crystal
- Tristate output for board test and debug
- -10/70 or -40/85 °C operating temperature
- Gold over nickel contact pads
- Hermetically sealed ceramic SMD package
- Product is compliant to RoHS directive
 and fully compatible with lead free assembly

Applications

- SONET/SDH/DWDM
- Ethernet, Gigabit Ethernet
- Storage Area Network
- Digital Video
- Broadband Access
- Microprocessors/DSP/FPGA

Description

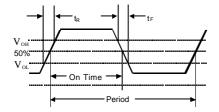

Vectron's VCC4 Crystal Oscillator (XO) is quartz stabilized square wave generator with a CMOS output, operating off either 1.8, 2.5, 3.3 or 5.0 volt supply.

The VCC4 uses fundamental or 3rd overtone crystals for output frequencies >50MHz resulting in low jitter performance. Also a monolithic IC, which improves reliability and reduces cost, is hermitically sealed.

Performance Characteristics

| Table 1. Electrical Performance, 5V op | tion | | | | |
|---|-----------------|--------------|-----------------|--------------|-------|
| Parameter | Symbol | Min | Typical | Maximum | Units |
| Frequency | f _O | 1.544 | | 75.000 | MHz |
| Operating Supply Voltage ¹ | V_{DD} | 4.5 | | 5.5 | V |
| Absolute Maximum Supply Voltage | | -0.7 | | 7.0 | V |
| Supply Current, Output Enabled | I_{DD} | | | | mΑ |

- 6. Output will be enabled if enable/disable is left open.

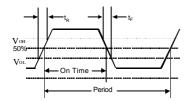

Figure 7. Output Waveform

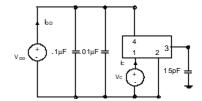

Figure 8. Typical Output Test Conditions (25±5°C)

Enable/Disable Functional Description

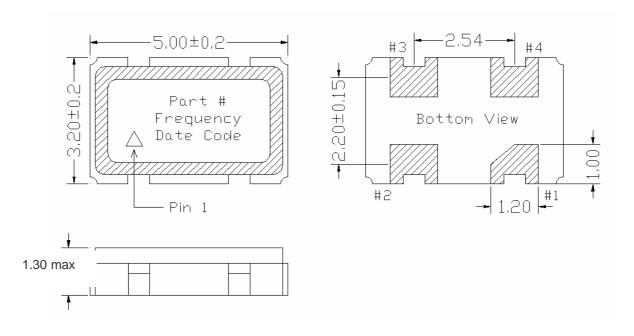

Under normal operation the Enable/Disable is left open, or set to a logic high state, and the VCC4 is oscillating. When the E/D is set to a logic low, the oscillator stops and the output is in a high impedance state. This helps reduce power consumption as well as facilitating board testing and troubleshooting.

TriState Functional Description

Under normal operation the Tristate is left open or set to a logic high state. When the Tri-State is set to a logic low, the oscillator remains active but the output buffer is in a high impedance state. This helps facilitate board testing and troubleshooting.

Outline Diagrams, Pad Layout and Pin Out

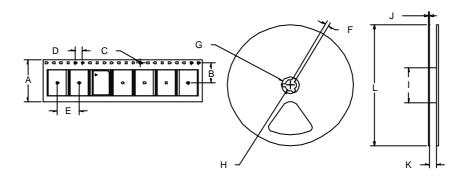

| Table 5. | Pinout | |
|----------|----------------|--------------------------------|
| Pin# | Symbol | Function |
| 1 | E/D or NC | Tristate, Enable/Disable or NC |
| 2 | GND | Electrical and Case Ground |
| 3 | f _o | Output Frequency |
| 4 | V_{DD} | Supply Voltage |

Contact Pads are gold over nickel Figure 9, Package drawing

Tape and Reel

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied at these or any other conditions in excess of conditions represented in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability.

| Table 7. Absolute Maximum Ratings | | | | | | | |
|-----------------------------------|----------|---------|------|--|--|--|--|
| Parameter | Symbol | Ratings | Unit | | | | |
| Storage Temperature | Tstorage | -55/125 | °C | | | | |

Reliability

The VCC4 qualification tests have included:

| Table 8. Environnemental Compliance | | | | | | |
|-------------------------------------|-------------------------|--|--|--|--|--|
| Parameter | Conditions | | | | | |
| Mechanical Shock | MIL-STD-883 Method 2022 | | | | | |
| Mechanical Vibration | MIL-STD-883 Method 2007 | | | | | |
| Temperature Cycle | MIL-STD-883 Method 1010 | | | | | |
| Solderability | MIL-STD-883 Method 2003 | | | | | |
| Gross and Fine Leak | MIL-STD-883 Method 1014 | | | | | |
| Resistance to Solvents | MIL-STD-883 Method 2015 | | | | | |

Handling Precautions

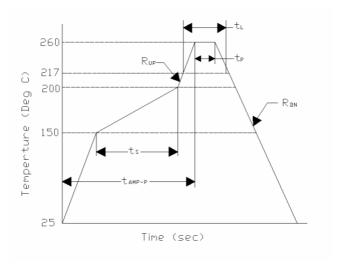

Although ESD protection circuitry has been designed into the the VCC4, proper precautions should be taken when handling and mounting. VI employs a Human Body Model and a Charged-Device Model (CDM) for ESD susceptibility testing and design protection evaluation. ESD thresholds are dependent on the circuit parameters used to define the model. Although no industry wide standard has been adopted for the CDM, a standard HBM of resistance = 1.5kohms and capacitance = 100pF is widely used and therefore can be used for comparison purposes.

| Table 9. ESD Ratings | | |
|----------------------|---------|-------------------------|
| Model | Minimum | Conditions |
| Human Body Model | 1000 | MIL-STD-883 Method 3115 |
| Charged Device Model | 1500 | JESD 22-C101 |

Suggested IR profile

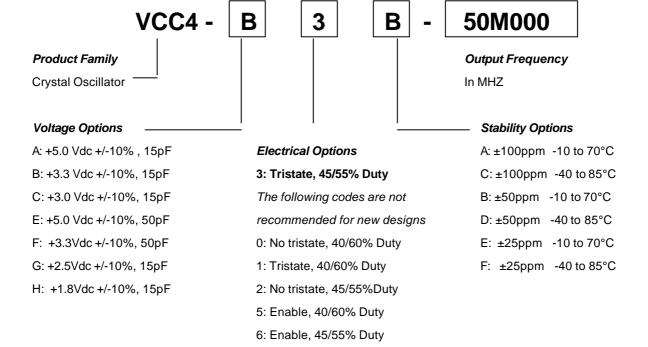

Devices are built using lead free epoxy and can also be subjected to standard lead free IR reflow conditions, Table 9 shows max temperatures and lower temperatures can also be used e.g. peak temperature of 220C.

| Parameter | Symbol | Value |
|------------------------|--------------------|--------------------------|
| reHeat Time | ts | 150 sec Min, 200 sec Max |
| amp Up | R _{UP} | 3 °C/sec Max |
| me Above 217 °C | t _L | 60 sec Min, 150 sec Max |
| ne To Peak Temperature | t _{AMB-P} | 480 sec Max |
| ne At 260 °C (max) | t _P | 10 sec Max |
| me At 240 °C (max) | t _{p2} | 60 sec Max |
| amp Down | R _{DN} | 6 °C/sec Max |

| Table 11. S | tandard Freq | uency List | | | | | |

Ordering Information

Note: Not all combinations are available.

Tristate with a 45/55% is the most common Electrical code and is recommended for most applications.
