

## Description

The HCPL-90xx and HCPL-09xx CMOS digital isolators feature high speed performance and excellent transient immunity specifications. The symmetric magnetic coupling barrier gives these devices a typical pulse width distortion of 2 ns , a typical propagation delay skew of 4 ns and 100 Mbaud data rate, making them the industry's fastest digital isolators.

The single channel digital isolators (HCPL-9000/-0900) features an active-low logic output enable. The dual channel digital isolators are configured as unidirectional (HCPL-9030/-0930) and bidirectional (HCPL-9031/-0931), operating in full duplex mode making it ideal for digital fieldbus applications.

The quad channel digital isolators are configured as unidirec-

Agilent HCPL-9000/-0900, -9030/-0930, HCPL-9031/-0931, -900J/-090J, HCPL-901J/-091J, -902J/-092J High Speed Digital Isolators Data Sheet

tional (HCPL-900J/-090J), two channels in one direction and two channels in opposite direction (HCPL-901J/-091J), and one channel in one direction and three channels in opposite direction (HCPL-902J/-092J). These high channel density make them ideally suited to isolating data conversion devices, parallel buses and peripheral interfaces.

They are available in 8-pin PDIP, 8-pin Gull Wing, 8-pin SOIC packages, and $16-$ pin SOIC narrow-body and wide-body packages. They are specified over the temperature range of $-40^{\circ} \mathrm{C}$ to $+100^{\circ} \mathrm{C}$.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation, which may be induced by ESD.

## Features

- +3.3V and +5V TTL/CMOS compatible
- 3 ns max. pulse width distortion
- 6 ns max. propagation delay skew
- 15 ns max. propagation delay
- High speed: 100 MBd
- $15 \mathrm{kV} / \mu \mathrm{s}$ min. common mode rejection
- Tri-state output (HCPL-9000/-0900)
- 2500 V RMS isolation
- UL1577 and IEC 61010-1 approved

## Applications

- Digital fieldbus isolation
- Multiplexed data transmission
- Computer peripheral interface
- High speed digital systems
- Isolated data interfaces
- Logic level shifting

## Agilent Technologies

Selection Guide

| Device Number | Channel Configuration | Package |
| :--- | :--- | :--- |
| HCPL-9000 | Single | 8-pin DIP (300 Mil) |
| HCPL-0900 | Single | 8-pin Small Outline |
| HCPL-9030 | Dual | 8-pin DIP (300 Mil) |
| HCPL-0930 | Dual | 8-pin Small Outline |
| HCPL-9031 | Dual, Bi-Directional | 8-pin DIP (300 Mil) |
| HCPL-0931 | Dual, Bi-Directional | 8-pin Small Outline |
| HCPL-900J | Quad | 16-pin Small Outline, Wide Body |
| HCPL-090J | Quad | 16-pin Small Outline, Narrow Body |
| HCPL-901J | Quad, 2/2, Bi-Directional | 16-pin Small Outline, Wide Body |
| HCPL-091J | Quad, 2/2, Bi-Directional | 16-pin Small Outline, Narrow Body |
| HCPL-902J | Quad, 1/3, Bi-Directional | 16-pin Small Outline, Wide Body |
| HCPL-092J | Quad, 1/3, Bi-Directional | 16-pin Small Outline, Narrow Body |

## Ordering Information

Specify Part Number followed by Option Number (if desired).
Examples:
HCPL-90xx-xxxx
xxxx:
No option $=300$ Mil PDIP-8 package, 50 units per tube. $300=$ Gull Wing Surface Mount Option, 50 units per tube.
$500=$ Tape and Reel Packaging Option, 1000 units per reel. xxxE = Lead-free Option.

## HCPL-09xx-xxxx

## xxxx:

No option = SO-8 package, 100 units per tube.
$500=$ Tape and Reel Packaging Option, 1500 units per reel. xxxE = Lead-free Option.

HCPL-90xJ-xxxx

## xxxx:

No option = Wide Body SOIC-16 package, 50 units per tube. $500=$ Tape and Reel Packaging Option, 1000 units per reel. xxxE = Lead-free Option.

HCPL-09xJ-xxxx
xxxx:
No option = Narrow Body SOIC-16 package, 50 per tube. $500=$ Tape and Reel Packaging Option, 1000 units per reel. $\mathrm{xxxE}=$ Lead-free Option.

## Notes:

1. Single and dual channels device are considered two-terminal devices: pins $1-4$ shorted and pins $5-8$ shorted. Quad channel devices are considered two-terminal devices: pins 1-8 shorted and pins $9-16$ shorted.

This product has been tested for electrostatic sensitivity to the limits stated in the specifications. However, Agilent recommends that all integrated circuits be handled with appropriate care to avoid damage. Damage caused by inappropriate handling or storage could range from performance degradation to complete failure.

## Notes:

1. PWD is defined as $\left|t_{\text {PHL }}-\mathrm{t}_{\text {PLH }}\right| . \% P W D$ is equal to the PWD divided by the pulse width.
2. $\mathrm{t}_{\text {PSK }}$ is equal to the magnitude of the worst case difference in $\mathrm{t}_{\mathrm{PHL}}$ and/or $\mathrm{t}_{\text {PLH }}$ that will be seen between units at $25^{\circ} \mathrm{C}$.
3. $\mathrm{CM}_{\mathrm{H}}$ is the maximum common mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{OUT}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common mode input voltage that can be sustained while maintaining $\mathrm{V}_{\text {OUT }}<0.8 \mathrm{~V}$. The common mode voltage slew rates apply to both rising and falling common mode voltage edges.

This product has been tested for electrostatic sensitivity to the limits stated in the specifications. However, Agilent recommends that all integrated circuits be handled with appropriate care to avoid damage. Damage caused by inappropriate handling or storage could range from performance degradation to complete failure.

## Applications Information

## Power Consumption

The HCPL-90xx and HCPL-09xx CMOS digital isolators achieves low power consumption from the manner by which they transmit data across isolation barrier. By detecting the edge transitions of the input logic signal and converting this to a narrow current pulse, which drives the isolation barrier, the isolator then latches the input logic state in the output latch. Since the current pulses are narrow, about 2.5 ns wide, the power consumption is independent of mark-to-space ratio and solely dependent on frequency.

The approximate power supply current per channel is: I (Input) $=40(\mathrm{f} / \mathrm{fmax})(1 / 4) \mathrm{mA}$ where $\mathrm{f}=$ operating frequency, fmax $=50 \mathrm{MHz}$.

## Signal Status on Start-up and Shut Down

To minimize power dissipation, the input signals to the channels of HCPL-90xx and HCPL-09xx digital isolators are differentiated and then latched on the output side of the isolation barrier to reconstruct the signal. This could result in an ambiguous output state depending on power up, shutdown and power loss sequencing. Therefore, the designer should consider the inclusion of an initialization signal in this start-up circuit.

## Bypassing and PC Board Layout

 The HCPL-90xx and HCPL-09xx digital isolators are extremely easy to use. No external interface circuitry is required because the isolators use high-speed CMOS IC technology allowing CMOS logicto be connected directly to the inputs and outputs. As shown in Figure 1, the only external components required for proper operation are two 47 nF ceramic capacitors for decoupling the power supplies. For each capacitor, the total lead length between both ends of the capacitor and the power-supply pins should not exceed 20 mm . Figure 2 illustrates the recommended printed circuit board layout for the HCPL-9000 or HCPL-0900. For data rates in excess of 10 MBd , use of ground planes for both $\mathrm{GND}_{1}$ and $\mathrm{GND}_{2}$ is highly recommended.

Note: C1, C2 $=47 \mathrm{nF}$ ceramic capacitors

Figure 1. Functional Diagram of Single Channel HCPL-0900 or HCPL-0900.

Figure 2. Recommended Printed Circuit Board Layout.

## Propagation Delay, Pulse Width

 Distortion and Propagation Delay Skew Propagation Delay is a figure of merit, which describes how quickly a logic signal propagates through a system as illustrated in Figure 3.The propagation delay from low to high, $\mathrm{t}_{\text {PLH }}$, is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low, $\mathrm{t}_{\mathrm{PHL}}$, is the amount of time required for the input signal to propagate to the output, causing the output to change from high to low.

Pulse Width Distortion, PWD, is the difference between $\mathrm{t}_{\mathrm{PHL}}$ and $t_{\text {PLH }}$ and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of $20-30 \%$ of the minimum pulse width is tolerable.

Propagation Delay Skew, $\mathrm{t}_{\mathrm{PSK}}$, and Channel-to-Channel Skew, $\mathrm{t}_{\mathrm{CSK}}$, are critical parameters to consider in parallel data transmission applications where synchronization of signals on parallel data lines is a concern.

Figure 3. Timing Diagrams to Illustrate Propagation Delay, $\mathrm{t}_{\mathrm{PLH}}$ and $\mathbf{t}_{\mathrm{PHL}}$.

Figure 5. Parallel Data Transmission.

Figure 4. Timing Diagrams to Illustrate
Propagation Delay Skew.

If the parallel data is being sent through channels of the digital isolators, differences in propagation delays will cause the data to arrive at the outputs of the digital isolators at different times. If this difference in propagation delay is large enough, it will limit the maximum transmission rate at which parallel data can be sent through the digital isolators.
$\mathrm{t}_{\mathrm{PSK}}$ is defined as the difference between the minimum and maximum propagation delays, either $t_{\text {PLH }}$ or $t_{\text {PHL }}$, among two or more devices which are operating under the same conditions (i.e., the same drive current, supply voltage, output load, and operating temperature). $\mathrm{t}_{\mathrm{CSK}}$ is defined as the difference between the minimum and maximum propagation delays, either $t_{\text {PLH }}$ or $t_{\text {PHL }}$, among two or more channels within a single device (applicable to dual and quad channel devices) which are operating under the same conditions.

As illustrated in Figure 4, if the inputs of two or more devices are switched either ON or OFF at the same time, $\mathrm{t}_{\mathrm{PSK}}$ is the difference between the minimum propagation delay, either $t_{\text {PLH }}$ or $t_{\text {PHL }}$, and the maximum propagation delay, either $t_{\text {PLH }}$ or $t_{\text {PHL }}$.

As mentioned earlier, $\mathrm{t}_{\mathrm{PSK}}$, can determine the maximum parallel data transmission rate. Figure 5 shows the timing diagram of a typical parallel data transmission application with both the clock and data lines being sent through the digital isolators. The figure shows data and clock signals at the inputs and outputs of the digital isolators. In this case, the data is clocked off the rising edge of the clock.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through a digital isolator. Figure 5 shows that there will be uncertainty in both the data and clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might arrive before all of
the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through digital isolators in a parallel application is twice $t_{\text {PSK }}$. A cautious design should use a slightly longer pulse width to
ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

Figure 6 shows the minimum pulse width, rise and fall time, and propagation delay enable to output waveforms for HCPL-9000 or HCPL-0900.

| $\mathbf{t}_{\text {PW }}$ | Minimum Pulse Width | $\mathbf{t}_{\text {PHZ }}$ | Propagation Delay, High to High Impedance |
| :--- | :--- | :--- | :--- |
| $\mathbf{t}_{\text {PLZ }}$ | Propagation Delay, Low to High Impedance | $\mathbf{t}_{\text {PZL }}$ | Propagation Delay, High Impedance to Low |
| $\mathbf{t}_{\text {PZH }}$ | Propagation Delay, High Impedance to High | $\mathbf{t}_{\mathbf{R}}$ | Rise Time |
|  |  | $\mathbf{t}_{\mathbf{F}}$ | Fall Time |

Figure 6. Timing Diagrams to Illustrate the Minimum Pulse Width, Rise and Fall Time, and Propagation Delay Enable to Output Waveforms for HCPL-9000 or HCPL-0900.
