DESCRIPTION

The '155 consists of two 1-to-4 line demultiplexers with independent strobes and common binary address inputs. When both sections are enabled by the strobes, the common address inputs sequentially select and route associated input data to the appropriate output of each section. The individual strobes permit activating or inhibiting each of the 4-bit sections as desired. Data applied to input C1 is inverted at its outputs and data applied to C2 is true through its outputs. The inverter following the C1 data input permits use as a 3-to-8 line decoder, or 1-to-8 line demultiplexer, without gating.

These devices provide speeds and drive capability equivalent to their ALSTTL counterparts and yet maintain CMOS power levels. The input and output voltage levels allow direct interface with TTL, NMOS and CMOS devices without any external components.

All inputs and outputs are protected from damage due to static discharge by internal diode clamps to V_{CC} and ground.
